Question: How does the **wavelength** and **intensity** of light affect its ability to free electrons from the surface of a material?

1. **Observe:** Click **Flash** the light with a variety of **Wavelength** values. What do you notice?

I notice that the higher the wavelength the less electrons move off the metal plate, but the lower the frequency the more electrons move of the metal plate.

2. **Observe:** Click **Flash** the light with a variety of **Intensity** values. What do you notice?

The higher the intensity the more electrons move of the metal plate.

3. **Form hypothesis:** Answer the following questions based on what you have observed so far.

- A. Which factor determines how many photons will strike the metal? **The Intensity**

Explain: Intensities control how strong the energy is being released.

- B. Which factor determines how much energy each photon has? **The wavelength**

Explain: Each wavelength has a different energy level so the lower the wavelength the higher the energy

4. **Investigate:** Set the **Intensity** to 10%. Use the **Gizmo** to determine the largest wavelength

that will dislodge an electron from the surface of the metal. What is this value? 550 nm

5. **Test:** Click **Flash** the light with an **Intensity** of 10% and again with an **Intensity** of 100%.

What happened? All the electrons moved off of the metal plate.

6. **Explore:** Set the **Wavelength** to 400 nm. Experiment with different intensities of light.

- A. Does the light intensity affect how many electrons are emitted? **Yes**

Explain: The higher the intensity the amount of electrons move off the metal plate.

- B. Does the light intensity affect the energy (speed) of the emitted electrons? **Yes**

Explain: I think it increases the strength of the wavelength as it makes the electrons move faster.

7. **Conclude:** Choose the best answer to each question.

(**Wavelength** **Intensity**) of a photon determines whether or not electrons are emitted off of a piece of metal. Wavelength is inversely proportional to (**velocity/frequency/amplitude**). Therefore, in order to send electrons from a piece of metal, photons must have a (long
