Proctor, 2016-08-19 Skill Acquisition and Training describes the building blocks of cognitive motor and teamwork skills and the factors to take into account in training them The basic processes of perception cognition and action that provide the foundation for understanding skilled performance are discussed in the context of complex task requirements individual differences and extreme environmental demands The role of attention in perceiving selecting and becoming aware of information in learning new information and in performance is described in the context of specific skills A theme throughout this book is that much learning is implicit the types of knowledge and relations that can profitably be learned implicitly and the conditions under which this learning benefits performance are discussed The question of whether skill acquisition in cognitive domains shares underlying mechanisms with the acquisition of perceptual and motor skills is also addressed with a view to identifying commonalities that allow for widely applicable general theories of skill acquisition Because the complexity of real world environments puts demands on the individual to adapt to new circumstances the question of how skills research can be applied to organizational training contexts is an important one To address this this book dedicates much content to practical applications covering such issues as how training needs can be captured with task and job analyses and how to maximize training transfer by taking trainee self efficacy and goal orientation into account This comprehensive yet readable textbook is optimized for students of cognitive psychology looking to understand the intricacies of skill acquisition **Handbook of Simulator-Based Training** Eric Farmer, John van Rooij, Johan Riemersma, Peter Jorna, 2017-03-02 Advances in simulation technology have enabled an interesting amount of training and instruction to be conducted on training simulators instead of on real systems However experiences with the procurement and use of training simulators has not always been as successful often owing to a lack of knowledge of didactics and of training programme development and also to inadequate simulator specifications The Handbook of Simulator based Training represents the first comprehensive overview of the European state of the art in simulator based training It also comprises a well founded and systematic approach to simulator based training and the specification of simulator requirements The multi disciplinary research project described in this book combines the expertise of specialists in human factors information systems system design and engineering from 23 research and industrial organizations from five countries France Germany the Netherlands Spain the UK The authors have synthesized and documented the project results to ensure

that this handbook provides not only many valuable guidelines but more importantly a common frame of reference It will be a key resource for the many specialists who are concerned with simulator based training researchers engineers and users military training institutes and training system development departments military staff responsible for the procurement of training devices and simulators the simulator industry the training research community and the human factors and ergonomics community

Simulation in Aviation Training Florian Jentsch, Michael Curtis, 2017-05-15 Simulations have been a fixture of aviation training for many years. Advances in simulator technology now enable modern flight simulation to mimic very closely the look and feel of real world flight operations. In spite of this, responsible researchers, trainers, and simulation developers should look beyond mere simulator fidelity to produce meaningful training outcomes. Optimal simulation training development can unquestionably benefit from knowledge and understanding of past, present, and future research in this topic area. As a result, this volume of key writings is invaluable as a reference to help guide exploration of critical research in the field. By providing a mix of classic articles that stand the test of time and recent writings that illuminate current issues, this volume informs a broad range of topics relevant to simulation training in aviation.

Energetics and Human Information Processing G.M. Hockey, Anthony W.K. Gaillard, Michael Coles, 1986-09-30 The central theme of this book is the role of energetical factors in the regulation of human information processing activity. This is a restatement of one of the classic problems of psychology: that of accounting for motivational or intensive aspects of behaviour as opposed to structural or directional aspects. The term energetics was first used in the 1930s by Freeman Duffy and others following Cannon's energy mobilization view of emotion and motivation. The original concept had a limited life, probably because of its unnecessary focus on relatively peripheral processes, but it provided the foundations for the concepts of arousal and

activation which became the popular motivational constructs of the 1950 s and 1960 s Now these too are found wanting The original assumptions of a unitary non specific process based on activation of the brain stem reticular formation have been shown to be misleading Current work in neurobiology has demonstrated evidence of discrete neurotransmitter systems having quite specific information processing functions and central roles in the regulation of behaviour Even the venerable curvilinear relationship between motivation and performance the Yerkes Dodson law has been shown to be at best an unhelpful oversimplification On a different front psychophysiolgists have found complex patterns in the response of different bodily systems to external stressors and to task demands

The Cognitive Neuroscience of Attention Joseph B. Hopfinger, Scott Slotnick, 2020-12-17 Attention refers to our ability to selectively process the vast array of stimuli impinging upon our senses at every moment The mental processes of attention are critical for allowing us to maintain focus and complete tasks efficiently even within distracting environments The brain mechanisms of attention have been studied for decades yet much still remains unknown and consensus on core issues remains elusive A unique aspect of this book are chapters that highlight recent debates on critical issues in attention research Each of these chapters includes a comprehensive discussion paper that is followed by peer commentaries and an authors responses These debates include whether attention can modulate activity of even the earliest cortical processing region and whether changes in white matter are critical for plasticity related effects of attention training In addition to these discussion chapters the book presents cutting edge research on some of the newest theories of attentional control and selective attention including the influence of practice epigenetics reward social interaction and distractor suppression These studies employ advanced cognitive neuroscience methods such as neurostimulation functional neuroimaging pattern analysis and the evaluation of oscillatory brain activity to shed light on the brain mechanisms underlying attention The chapters in this book were originally published as articles in various issues of the journal Cognitive Neuroscience

Epistemic Dimensions of Personhood Simon Evnine, 2008-05-15 Simon Evnine argues that all persons must share certain epistemic features They must possess particular logical concepts and their beliefs must conform to certain principles of rationality However they cannot be completely objective about their own beliefs These features deepen our understanding of what it is to be a person
