Dependable Computing for Critical Applications 3 Carl E. Landwehr, Brian Randell, Luca Simoncini, 2013-06-29 This volume contains the papers presented at the Third IFIP International Working Conference on Dependable Computing for Critical Applications sponsored by IFIP Working Group 10.4 and held in Mondello Sicily Italy on September 14-16 1992 System developers increasingly apply computers where they can affect the safety and security of people and equipment The Third IFIP International Working Conference on Dependable Computing for Critical Applications like its predecessors addressed various aspects of computer system dependability a broad term defined as the degree of trust that may justifiably be placed in a system's reliability availability safety security and performance Because the scope of the conference was so broad we hope the presentations and discussions will contribute to the integration of these concepts so that future computer based systems will indeed be more dependable The Program Committee selected 18 papers

for presentation from a total of 74 submissions at a May meeting in Newcastle upon Tyne UK The resulting program represented a broad spectrum of interests with papers from universities corporations and government agencies in eight countries Much diligent work by the Program Committee and the quality of reviews from more than a hundred external referees from around the world for which we are most grateful significantly eased the production of this technical program

Dependable Computing for Critical

Applications Algirdas Avizienis, Jean-Claude Laprie, 2012-12-06 The International Working Conference on Dependable Computing for Critical Applications was the first conference organized by IFIP Working Group 10.4 Dependable Computing and Fault Tolerance in cooperation with the Technical Committee on Fault Tolerant Computing of the IEEE Computer Society and the Technical Committee 7 on Systems Reliability Safety and Security of EWICS. The rationale for the Working Conference is best expressed by the aims of WG 10.4: Increasingly individuals and organizations are developing or procuring sophisticated computing systems on whose services they need to place great reliance. In differing circumstances the focus will be on differing properties of such services: e.g. continuity, performance, real time response, ability to avoid catastrophic failures, prevention of deliberate privacy intrusions. The notion of dependability, defined as that property of a computing system which allows reliance to be justifiably placed on the service it delivers, enables these various concerns to be subsumed within a single conceptual framework. Dependability thus includes as special cases such attributes as reliability, availability, safety, security. The Working Group is aimed at identifying and integrating approaches, methods and techniques for specifying, designing, building, assessing, validating, operating and maintaining computer systems which should exhibit some or all of these attributes. The concept of WG 10.4 was formulated during the IFIP Working Conference on Reliable Computing and Fault Tolerance on September 27-29, 1979, in London, England, held in conjunction with the Europ IFIP 79 Conference. Prof. A. Avizienis, UCLA, Los Angeles, USA, and A. Laprie, CNRS, Toulouse, France.

[Debugging Embedded and Real-Time Systems](#) Arnold S. Berger, 2020-07-17 Debugging Embedded and Real Time Systems: The Art, Science, Technology, and Tools of Real Time System Debugging gives a unique introduction to debugging skills and strategies for embedded and real time systems. Practically focused, it draws on application notes and white papers written by the companies who create design and debug tools. Debugging Embedded and Real Time Systems presents best practice strategies for debugging real time systems through real life case studies and coverage of specialized tools such as logic analysis, JTAG debuggers, and performance analyzers. It follows the traditional design life cycle of an embedded system and points out where defects can be introduced and how to find them and prevent them in future designs. It also studies application performance monitoring, the execution trace recording of individual applications, and other tactics to debug and control individual running applications in the multitasking OS. Suitable for the professional engineer and student, this book is a compendium of best practices based on the literature as well as the author's considerable experience as a tools developer. Provides a unique reference on Debugging Embedded and Real Time Systems. Presents best practice strategies for debugging real time systems. Written by an author with many years of experience as a tools developer. Includes real life case studies that show how debugging skills can be improved. Covers logic analysis, JTAG debuggers, and performance analyzers that are used for designing and debugging embedded systems. *Computer Sciences*
