## KEY IDEAS

As you read this section, keep these questions in mind:

- What are two cultures that contributed to modern science?
- What are the four main branches of Earth science?
- How do Earth scientists help us understand the world?

## How Did Ancient People Study Earth?

People have wondered about natural events on Earth for thousands of years. They felt earthquakes shake the ground, saw volcanoes erupt, and watched eclipses darken the sky.

Some people created myths or stories to explain how these events happened. Others carefully watched and studied these events. They tried to learn what caused the events. Each time someone discovered a possible cause, it helped people develop explanations for other events.

The table below shows some historical observations that were important to the study of Earth.

| Approximate Date | Development                                                                |
|------------------|----------------------------------------------------------------------------|
| 780 BCE          | People in China began to keep records about earthquakes.                   |
| 200 BCE          | Ancient Greeks gathered and recorded information about rocks and minerals. |
| 300–900 CE       | Ancient Maya watched the moon and recorded information about eclipses.     |
| 1600s            | The microscope was invented.                                               |
| 1700s            | The telescope was invented.                                                |

For a long time, people could use only their unaided eyes to study Earth and space. After the telescope and microscope were invented, people could observe objects and events more clearly. For example, Galileo used a telescope to see Jupiter's moons.

Today, scientists continue to study the natural world. **Earth science** is the study of Earth and the universe around it. Earth scientists use observations and experiments to find the causes of events in nature. 

## READING TOOLBOX

**Repairing the Climate** L.J. Reinders, 2024-11-01 Climate change is triggered by a too high concentration of greenhouse gases in the air carbon dioxide in particular primarily originating from fossil fuel burning Since such burning will not stop any time soon the concentration will undoubtedly rise further exacerbating climate change There is no escape from this That is where carbon capture comes in direct air capture DAC scrubs the surplus carbon dioxide out of the air for actually lowering this concentration At the same time emission levels must be drastically lowered by fitting point source emitters with carbon capture installations This book sets out the case for such carbon capture which is a must without which the climate cannot be repaired
