THE ORDERS OF INSECTS THE CLASSIFICATION AND PHYLOGENY OF INSECTS The classification of insects has passed through many changes and with the growth of detailed knowledge an increasing number of orders has come to be recognized Handlirsch 1908 and Wilson and Doner 1937 have reviewed the earlier attempts at classification among which the schemes of Brauer 1885 Sharp 1899 and Börner 1904 did much to define the more distinctive recent orders In 1908 Handlirsch published a more revolutionary system incorporating recent and fossil forms which gave the Collembola Thysanura and Diplura the status of three independent Arthropodan classes and considered as separate orders such groups as the Sialoidea Raphidioidea Heteroptera and Homoptera He also split up the old order Orthoptera gave its components ordinal rank and regrouped them with some of the other orders into a subclass Orthopteroidea and another subclass Blattaeformia *Imms'*

Imms' Outlines of Entomology O. W. Richards,2013-03-09 In his preface to early editions of this book the late Dr A D Imms said that he intended it to be an elementary account of entomology as a branch of general biology He had especially in mind the needs of university students of zoology and agriculture as well as those intending later to specialize in entomology and he suggested that the book might also interest teachers of advanced biology in schools These general aims and the balance between the different aspects of the subject have changed little in this and in our previous revision We have however tried to bring the present edition up to date on the lines of our revised tenth edition of *Imms General Textbook of Entomology* published in 1977 The text has been entirely re-set and eleven illustrations have been replaced by new figures The same orders of insects are recognized as in the last edition but the sequence in which the Endopterygota groups appear has been changed to reflect more accurately their probable evolutionary relationships Many small changes and some additions have been made in the physiological sections the chapter on the origin and phylogeny of insects has been rewritten and a new bibliography provides a selection of modern references for the intending specialist It has been our object to make these alterations without materially increasing the length of the book or its level of difficulty

**The Ecology of Scotland's Largest Lochs** Peter S.

Maitland, 2012-12-06 Scotland is fortunate in being very richly endowed with natural fresh waters in the form of numerous lochs and rivers. These constitute on the one hand an attractive feature of the landscape and on the other a major resource for industry and recreation. Thus there are about 3800 lochs over 4 ha in area and these form approximately 1.0% of the total surface area of Scotland. Comparable figures for England and Wales are 1700 lakes and 0.05% of the land surface and in terms of volume Loch Ness contains more water than all the lakes and reservoirs in England and Wales put together. Smith Lyle 1979. Many of the Scottish lochs are large and clean and consequently are particularly valuable in resource terms. The decision as to which are actually the largest lochs is debatable, particularly when the main criteria of greatest surface area, length, volume and depth each gives a different water. Lochs Lomond, Awe, Ness and Morar respectively. These four then are certainly among the largest lochs in the country but close to them in size come several other large waters among which is Loch Shiel which is exceeded in length only by Lochs Awe, Ness and Lomond. These five very large lochs form the group of waters selected for the comparative studies described in this volume.
