Numerical Solution Of The American Option Pricing Problem, The: Finite Difference And Transform Approaches Carl Chiarella, Boda Kang, Gunter H Meyer, 2014-10-14 The early exercise opportunity of an American option makes it challenging to price and an array of approaches have been proposed in the vast literature on this topic In The Numerical Solution of the American Option Pricing Problem Carl Chiarella Boda Kang and Gunter Meyer focus on two numerical approaches that have proved useful for finding all prices hedge ratios and early exercise boundaries of an American option One is a finite difference approach which is based on the numerical solution of the partial differential equations with the free boundary problem arising in American option pricing including the method of lines the component wise splitting and the finite difference with PSOR The other approach is the integral transform approach which includes Fourier or Fourier Cosine transforms Written in a concise and systematic manner Chiarella Kang and Meyer explain and demonstrate the advantages and limitations of each of them based on their and their co workers experiences with these approaches over the years

Physical Acoustics M.A. Breazeale, O. Leroy, 2012-12-06 This book contains 17 invited papers and 80 communicated papers presented at the International Symposium on Physical Acoustics held at the University Campus of Kortrijk Belgium from 19-22 June 1990. The twenty-fifth anniversary of the Campus was celebrated with special activities such as concerts, exhibitions and scientific meetings. This symposium was a part of the celebration. The 120 participants came from 18 different countries. Among the largest groups we mention 32 French contributions and 19 contributions from the U.S.S.R. We especially thank Prof. V.V. Proklov from Moscow and Prof. S.V. Kulakov from Leningrad who helped us with the distribution of invitations in the U.S.S.R. We also thank Prof. G. Quentin and Ir. B. Poiree from Paris who endeavored to inform all French acousticians. We thank all the lecturers for their effort in producing the material for the book in time. The invited lectures have been collected and retyped by Prof. M. Breazeale, U.S.A. while the contributed papers were collected by Prof. O. Leroy and retyped in Belgium. The first 200 pages of the book comprise the invited lectures, not classified by topic but are in alphabetical order with reference to the first author. The second part of the book contains the contributed papers and posters, also classified in alphabetical order according to the first author.

Partial Differential Equations and Boundary-Value Problems with Applications Mark A. Pinsky, 2011 Building on the basic techniques of separation of variables and Fourier series, the book presents the solution of boundary value problems for basic partial differential equations: the heat equation, wave equation, and Laplace equation, considered in various standard coordinate systems: rectangular, cylindrical, and spherical. Each of the equations is derived in the three-dimensional context; the solutions are organized according to the geometry of the coordinate system, which makes the mathematics especially transparent. Bessel and Legendre functions are studied and used whenever appropriate throughout the text. The notions of steady-state solution and closely related stationary solutions are developed for the heat equation; applications to the study of heat flow in the earth are presented. The problem of the vibrating string is studied in detail both in the Fourier transform setting and from the viewpoint of the explicit representation of d'Alembert's formula. Additional chapters include the numerical analysis of solutions and the method of Green's functions for solutions of partial differential equations. The exposition also includes asymptotic methods, Laplace transform, and stationary phase. With more than 200 working examples and 700 exercises, more than 450 with answers, the book is suitable for an undergraduate course in partial differential equations.
