Multiple Instance Learning Francisco

Herrera, Sebastián Ventura, Rafael Bello, Chris Cornelis, Amelia Zafra, Dánel Sánchez-Tarragó, Sarah Vluymans, 2016-11-08 This book provides a general overview of multiple instance learning MIL defining the framework and covering the central paradigms The authors discuss the most important algorithms for MIL such as classification regression and clustering With a focus on classification a taxonomy is set and the most relevant proposals are specified Efficient algorithms are developed to discover relevant information when working with uncertainty Key representative applications are included This book carries out a study of the key related fields of distance metrics and alternative hypothesis Chapters examine new and developing aspects of MIL such as data reduction for multi instance problems and imbalanced MIL data Class imbalance for multi instance problems is defined at the bag level a type of representation that utilizes ambiguity due to the fact that bag labels are available but the labels of the individual instances are not defined Additionally multiple instance multiple label learning is explored This learning framework introduces flexibility and ambiguity in the object representation providing a natural formulation for representing complicated objects Thus an object is represented by a bag of instances and is allowed to have associated multiple class labels simultaneously This book is suitable for developers and engineers working to apply MIL techniques to solve a variety of real world problems It is also useful for researchers or students seeking a thorough overview of MIL literature methods and tools

Face Detection and Adaptation Cha Zhang, Zhengyou Zhang, 2010-10-10 Face detection because of its vast array of applications is one of the most active research areas in computer vision In this book we review various approaches to face detection developed in the past decade with more emphasis on boosting based learning algorithms We then present a series of algorithms that are empowered by the statistical view of boosting and the concept of multiple instance learning We start by describing a boosting learning framework that is capable to handle billions of training examples It differs from traditional bootstrapping schemes in that no intermediate thresholds need to be set during training yet the total number of negative examples used for feature selection remains constant and focused on the poor performing ones A multiple instance pruning scheme is then adopted to set the intermediate thresholds after boosting learning This algorithm generates detectors that are both fast and accurate We then present two multiple instance learning schemes for face detection multiple instance learning boosting MILBoost and winner take all multiple category boosting WTA McBoost MILBoost addresses the uncertainty in accurately pinpointing the location of the object being detected while WTA McBoost addresses the uncertainty in determining the most appropriate subcategory label for multiview object detection Both schemes can resolve the ambiguity of the labeling process and reduce outliers during training which leads to improved detector performances In many applications a detector trained with generic data sets may not perform optimally in a new environment We propose detection adaption which is a promising solution for this problem We present an adaptation scheme based on the Taylor expansion of the boosting learning objective function and we propose to store the second order statistics of the generic training data for future adaptation We show that with a small amount of labeled data in the new environment

the detector's performance can be greatly improved. We also present two interesting applications where boosting learning was applied successfully. The first application is face verification for filtering and ranking image video search results on celebrities. We present boosted multi task learning (MTL), yet another boosting learning algorithm that extends MILBoost with a graphical model. Since the available number of training images for each celebrity may be limited, learning individual classifiers for each person may cause overfitting. MTL jointly learns classifiers for multiple people by sharing a few boosting classifiers in order to avoid overfitting. The second application addresses the need of speaker detection in conference rooms. The goal is to find who is speaking given a microphone array and a panoramic video of the room. We show that by combining audio and visual features in a boosting framework, we can determine the speaker's position very accurately. Finally, we offer our thoughts on future directions for face detection.
