## Syntax

\$ ip [options] OBJECT COMMAND

Display the command syntax and lists all available options

\$ ip help

## IP Objects

OBJECTS	DESCRIPTION
address	IPv4 or IPv6 addresses on a device
link	Network interfaces for example Wi-Fi adapters and wired connections
route	Routing table entry
maddress	Multicast address
neighbour	Neighbor entry, which contains information about a neighboring device on the network.
mroute	Multicast routing cache entry
rule	Rule in routing policy database

## Quick Tip

When working with the IP command, you can save time by using shortened or abbreviated object names. For instance, instead of typing "address," you can simply use "addr" or even just "a." Give it a shot!

## IP Options

-p	Adds indentation to the JSON output for readability
-s	Display extra statistics
-b	Instructs IP to display only IPv6 Addresses
-h	Output statistics with human readable values
-c	Enable colored output
-t	Display timestamps in the output
-b	Print only basic information in a tabular format

## IP Command vs Net-Tools

NET-TOOLS	IPROUTE COMMANDS (IP)
\$ arp -a	\$ ip neigh

\$ ip route add default via 192.168.1.1 dev wlan0	Add the default route
\$ ip route del default	Delete the default route
\$ ip route del 192.168.0.0/24 via 192.168.0.1	Delete the specified route

## Manage Neighbour Entries

\$ ip neigh del 192.168.0.2 dev wlan0	Remove the ARP entry

## Important

When making changes to network interfaces, addresses, or routes, exercise extreme caution. It is simple to disconnect the server from the main network, which may require a system reboot to fix. When experimenting with new commands in a test environment or non-critical systems.

support for the TCP/IP Internet protocol suite TCP/IP is a large and evolving collection of communication protocols managed by the Internet Engineering Task Force (IETF), an open volunteer organization. Because of its openness, the TCP/IP protocol suite has become the foundation for the set of technologies that form the basis of the Internet. The convergence of IBM mainframe capabilities with Internet technology connectivity and standards, particularly TCP/IP, is dramatically changing the face of information technology and driving requirements for ever more secure, scalable, and highly available mainframe TCP/IP implementations. In this IBM Redbooks publication, we begin with a discussion of Virtual IP Addressing (VIPA), a TCP/IP high availability approach that was introduced by the z/OS Communications Server. We then show how to use VIPA for high availability both with and without a dynamic routing protocol. We also discuss a number of different workload balancing approaches that you can use with the z/OS Communications Server. We also explain the optimized Sysplex Distributor intra-sysplex load balancing. This function represents improved multitier application support using optimized local connections together with weight values from extended Workload Manager (WLM) interfaces. Finally, we highlight the most important tuning parameters and suggest parameter values that we observed to maximize performance in many client installations.
