

Genetics Practice Problems: Pedigree Tables

Remember the following when working pedigree tables:

- 1. Circles are females and squares are males.
- 2. A shaded circle or square indicates that a person has the trait.

The pedigree chart below is the inheritance of color blindness. Shaded individuals are colorblind. First, determine the probable genotype of person 1 = 11. Then answer the questions below the table.

What do you know about the genotype of the mother of 11?

These people (11) had a color blind son (12). His dad is normal, his color blind mom, from his mother. Since the mother is not shaded she must be a carrier.

Number 11 is colorblind just like her father. Where could she get her allele for colorblindness?

She inherited her allele for colorblindness from her mother. Must have been that 11 inherited it from their father.

Number number 21 and 23 were colorblind. How did they have a colorblind son (31)?

Both mother (21) and father (23) are colorblind for color blindness.

What must be the genotype of the parents of a colorblind daughter (34)?

To have a color blind daughter, she must have the recessive allele from each parent. Her father must be $X^c Y$ and mother must have to be $X^c X^c$.

If mother 21 has a normal son, what is the probability that their son will be colorblind?

$X^N X^c \times X^c Y \rightarrow$ all of their sons will be colorblind.

(50%) (normal male)
