Genetic Crosses With Two Traits

In his work with garden peas, Mendel also set up crosses in which he studied the inheritance of two traits at one time. For example, he crossed tall plants having green pods (TTGG) with short plants having yellow pods (ttgg). The F₁ offspring showed both traits controlled by dominant alleles, tall and green. Mendel allowed the F₁ offspring to self-pollinate. The F₂ offspring had four different phenotypes: tall plants with green pods, tall plants with yellow pods, short plants with green pods, and short plants with yellow pods. These results led Mendel to formulate the Law of Independent Assortment, which states that alleles of one gene separate or assort independently of alleles of another gene. In other words, the distribution of alleles of one gene does not affect the distribution of alleles for another gene.

Study the Punnett square of a genetic cross between two pea plants with two different traits. Then answer the questions that follow.

Answer the following questions on a separate sheet of paper.

1. What are all the possible combinations of alleles that each F₁ parent can pass on to the offspring?
2. What are the possible genotypes of the F₂ offspring? What are the possible phenotypes of the F₂ offspring?
3. What is the probability that an F₂ offspring will be tall with green pods? What is the probability that an F₂ offspring will be short with yellow pods?

Karley, Scott N. Johnson, Rex Brennan, Peter J. Gregory, 2019-04-17 With global populations expected to exceed 9.2 billion by 2050 and available land and water resources devoted to crop production dwindling we face significant challenges to secure global food security Only 12 plant species feed 80% of the world's population with just three crop species wheat rice and maize accounting for food consumed by 50% of the global population Annual losses to crop pests and pathogens are significant thought to be equivalent to that required to feed a billion people at a time when crop productivity has plateaued With pesticide applications becoming increasingly unfeasible on cost efficacy and environmental grounds there is growing interest in exploiting plant resistance and tolerance traits for crop protection Indeed mankind has been selectively breeding plants for desirable traits for thousands of years However resistance and tolerance traits have not always been those most desired and in many cases have been inadvertently lost during the domestication process crops have been effectively disarmed by domestication Moreover mechanistic understanding of how resistance and tolerance traits operate is often incomplete which makes identifying the right combination for crop protection difficult We aimed to address this Research Topic by inviting authors to contribute their knowledge of appropriate resistance and tolerance traits explore what is known about durability and breakdown of defensive traits and finally asking what are the prospects for exploiting these traits for crop protection The research topic summarised in this book addresses some of the most important issues in the future sustainability of global crop production Life Science, Grades 6-7 Tony Wright, 1994-07-13 **Biology** Kenneth Raymond Miller, Prentice Hall (School Division), 1999-02 **Teacher's Wraparound Edition: Two Biology Everyday Experience** Albert Kaskel, 1994-04-19 *Nutritional Genomics* Wayne R. Human Molecular Genetics Jamie Benton &, 2019-01-23 Molecular Genetics is one of the fast moving fields of science that has undergone a variable revolution over the last two decades leading to major advances in the understanding of gene structure and function at molecular level Human Molecular Genetics is the study of the molecular basis of human genetic disease developmental genetics neurogenetics chromosome structure and function molecular aspects of cancer genetics gene therapy biochemical genetics major advances in gene mapping and understanding of genome organization Genetics is the study of how genes bring about characteristics or traits in living things and how those characteristics are inherited Genes are portions of DNA molecules that determine characteristics of living things Through the processes of meiosis and reproduction genes are transmitted from one generation to the next Heredity is a biological process where a parent passes certain genes onto their children or offspring Genetics uses information from one or two genes to explain a disease or condition whereas genomics examines all of the genetic information to determine biological markers predisposing an individual to disease Genes are the best understood subsequence of DNA code Most genes clearly encode the data sequence representing a particular protein However all of the genes together are only a small part of DNA code The 30 000 odd genes in human DNA might only make up 4% of human DNA This book presents a view in depth of the principal aspects of life science Each chapter treats a discrete topic within the scope of biology and each is designed for students who are exposed to the topics for the first time Since considerable ferment exists in the biological sciences today it is increasingly important to keep pace with current developments

Sustainable use of Genetic Diversity in Forage and Turf Breeding Christian Huyghe, 2010-06-10 Grassland produces feed for livestock improves soil fertility and structure protects water resources and may contribute to climate change mitigation through carbon storage and to biodiversity preservation It simultaneously maintains sustainable economic outputs for farmers and provides ecosystem services Turf similarly considerably contributes to our environment by adding beauty to our surroundings providing a safe playing surface for sports

and recreation The species diversity present in most grasslands and turfs is a functional diversity contributing to the previously mentioned agronomic and environmental benefits The species belong to different functional groups and the adequate species composition may maximise the agronomic performance through a higher production and a better quality and the environmental benefits through symbiotic nitrogen fixation or sources of pollen and nectar to pollinators In a given grassland or turf the genetic diversity available in each variety contributes to this economic and environmental performance but also to the stability of these performances including the stability of the resistance against pathogens and pests Natural grasslands share many species with the sown swards They may be regarded as favourable sites for in situ preservation of genetic diversity as well as valuable sources of diversity for breeding
