If an abend occurs during testing, Fault Analyzer enables the programmer to quickly and easily pinpoint the abending location and optionally the failing line of code. Many times this information is all the programmer requires to correct the problem. However, it might be necessary to delve a little deeper into the code to figure out the problem.

Debug Tool allows the programmer to step through the code at whatever level is required to determine where the error was introduced or encountered After the code or data is corrected the same process is followed again until no errors are encountered However volume testing or testing with multiple terminals is sometimes required to ensure real world reliability Workload Simulator can be used to perform this type of testing After all of the tests are completed running the application by using Application Performance Analyzer can ensure that no performance bottlenecks are encountered It also provides a baseline to ensure that future enhancements do not introduce new performance degradation into the application This publication is intended for z OS application developers and system programmers
