   Language-based Security for Web Browsers Dongseok Jang,2014 Web browsers are one of the most security critical applications that billions of people use to access their private information ranging from bank statements to medical records However we have witnessed numerous browser security vulnerabilities that allow attackers to steal these information or hijack a user s machine in the last decade Many of these security vulnerabilities are rooted in the lack of security support from programming languages used in browsers First JavaScript the browser side scripting language lacks flexible language constructs to isolate code originating from different websites despite the common practice of merging JavaScript programs from untrusted sources into one web page As a result JavaScript attacks have affected numerous sites Second C the language in which major browsers are implemented does not guarantee memory safety As a result memory corruption attacks are prevalent in browsers in the worst scenario memory corruption attacks can hijack a user s machine Third due to the lack of reasoning support C makes it challenging to implement correct and thorough security policies in browsers comprising millions of lines of code Loopholes in implementations have thus been exploited to circumvent intended security measures These factors suggest that we can retrofit these languages with security relevant constructs or incorporate a security oriented language to address these problems This dissertation argues that we can adapt language techniques to improve browser security To support this argument we present the following contributions First we present a dynamic information flow framework for JavaScript to detect and prevent data stealing attacks in JavaScript web applications Second we present SafeDispatch an enhanced C compiler that prevents C control flow hijacking attacks a class of attacks that exploit vtable pointers in the browser Third we present Quark a browser with a kernel formally verified to satisfy crucial security properties even when another browser component is compromised We highlight experimental results showing that each of our

contributions is a practical defense mechanism against various browser security problems We have implemented our proposals in real browsers such as Chromium and Webkit and showed that they successfully run on real websites including Google Amazon and Facebook
