

Equations of Motion

$$m_i \ddot{\mathbf{r}}_i = \mathbf{F}_i$$

$$\mathbf{J}_i \circ \dot{\boldsymbol{\omega}}_i + \boldsymbol{\omega}_i \times \mathbf{J}_i \circ \boldsymbol{\omega}_i = \mathbf{T}_i$$

$$\underline{\ddot{q}}_i = \underline{M}_i \underline{\dot{Y}}_i + \underline{Q}_i$$

The constraint forces and torques can be eliminated using the principle of virtual work

- $\underline{\dot{Y}}_i$ is a 6×1 column matrix that contains the components of the linear and angular acceleration of the base of the lower numbered body i .

- Matrices $\underline{M}_i$ and $\underline{Q}_i$ are calculated successively, starting with body N to body 1
- This algorithm yields the second time derivatives of the joint coordinates in explicit form
- Two explicit numerical integration methods
 - Fourth order Runge- Kutta method that uses a constant time step;
 - Fifth order Runge-Kutta- Merson method which uses a variable time step that is controlled by the local truncation error.

IUTAM Symposium on Impact Biomechanics: From Fundamental Insights to Applications M. D. Gilchrist, 2005-10-13 Substantial fundamental work has been undertaken in the different aspects of impact biomechanics over the past three decades Much of this has been motivated and undertaken by the automotive industry in their efforts to improve transport safety More recently however it has become apparent that the multidisciplinary synergies which are realised by interactions between engineers scientists and clinical practitioners will ultimately lead to a greater understanding of the complex interacting phenomena within the human body after it has sustained an impact In turn this greater depth of knowledge will provide more fundamental insights into the analysis diagnosis treatment and prevention of impact injuries across a broader spectrum of accident environments The scientific focus of this IUTAM symposium is to address those topics that are centrally important to the biomechanics of impact These can be grouped into those that are concerned with the different causes of accidents e.g transport occupational and sports injuries the mechanics involved in accident analysis e.g accident investigation computational modelling techniques the different types of resulting traumatic injuries including musculoskeletal organ spinal and head injuries methods of assessing the extent of injury e.g injury assessment injury criteria constitutive laws for human tissue and providing protection during an impact e.g injury prevention energy absorption materials and safety devices

DHM and Posturography Sofia Scataglini, Gunther Paul, 2019-08-22 DHM and Posturography explores the body of knowledge and state of the art in digital human modeling along with its application in ergonomics and posturography The book provides an industry first introductory and practitioner focused overview of human simulation tools with detailed chapters describing elements of posture postural interactions and fields of application Thus DHM tools and a specific scientific practical problem the study of posture are linked in a coherent framework In addition sections show how DHM interfaces with the most common physical devices for posture analysis Case studies provide the applied knowledge necessary for practitioners to make informed decisions Digital Human Modelling is the science of representing humans with their physical properties characteristics and behaviors in computerized virtual models These models can be used standalone or integrated with other computerized object design systems to design or study designs workplaces or products in their relationship with humans Presents an introductory up to date overview and introduction to all industrially relevant DHM systems that will enable users on trialing procurement decisions and initial applications Includes user level examples and case studies of DHM application in various industrial fields Provides a structured and posturography focused compendium that is easy to access read and understand

Nonlinear Interval Optimization for Uncertain Problems Chao Jiang, Xu Han, Huichao Xie, 2020-12-08 This book systematically discusses nonlinear interval optimization design theory and methods Firstly adopting a mathematical programming theory perspective it develops an innovative mathematical transformation model to deal with general nonlinear interval uncertain optimization problems which is able to equivalently convert complex interval uncertain optimization problems to simple deterministic optimization problems This model is then used as the basis for various interval uncertain optimization algorithms for engineering applications which address the low efficiency caused by double layer nested optimization Further the book extends the nonlinear interval optimization theory to design problems associated with multiple optimization objectives multiple disciplines and parameter dependence and establishes the corresponding interval optimization models and solution algorithms Lastly it uses the proposed interval uncertain optimization models and methods to deal with practical problems in mechanical engineering and related fields demonstrating the effectiveness of the models and methods
