Global Free Trade Error Ron Baiman, 2017-02-24 The doctrine of free trade is second only to that of free markets in undergirding ideological support for our current global economic structures and rules. From David Ricardo's comparative advantage principle to James Meade's Neoclassical or mainstream economics proof of self-adjusting free trade equilibrium, the free trade doctrine has had a lasting and destructive hold on Neoclassical economic thinking since its inception. The Global Free Trade Error provides a detailed analysis of these foundational models and counterposes these to alternative Neo-Marxist unequal exchange models of global trade and finance. In the first part of the book, the three core free trade models alluded to above are respectively demonstrated to be overdetermined, inapplicable, and infeasible. In particular, Ricardo's parable is shown to support managed trade rather than free trade, as Ricardo and two centuries of economic texts have claimed. In the second part of the book, unequal exchange analyses of global trade are shown to provide logically coherent and useful insights into global trade and finance. In the third and final part of the book, this unequal exchange perspective is used within a general demand and cost setting to develop a set of global managed trade principles for a more equitable and sustainable world trade regime. This book will be of great interest to those who study political economy, history of economic thought, and international trade, including trade agreements and tariffs. **Breakeven Analysis** Michael E. Cafferky, Jon

Cafferky is the Ruth McKee Chair for Entrepreneurship and Business Ethics at Southern Adventist University's School of Business and Management. In addition to a doctoral degree in business from Anderson University Falls School of Business, he also holds masters degrees in public health and religion. The author of eight books, Cafferky is a member of the Academy of Management and the Christian Business Faculty Association. He has received Southern's President's Award for Excellence in Scholarship and the national Sharon Johnson Award from the Christian Business Faculty Association. **Managerial**

Managerial Economics, 9e D N Dwivedi, This well known book on the subject has stood the test of time for the last 35 years because of the quality of presentation of its text It has become students favourite as it provides the latest theories thoughts and applications on the subject with timely revisions to stay up to date all the time Since its first edition it has provided complete comprehensive and authentic text on micro and macro aspects of managerial economics It has now been revised thoroughly with added interpretations of economic theories and concepts and their application to managerial decisions *Energy Demand in Industry* Nabaz T Khayyat, 2015-08-07 The book presents a stochastic analysis based on production risk and application of this method in the industrial sector under production risk where energy use is an input factor Using South Korea as a case study the book empirically models energy demand at the industrial level and analyzes the results to identify key determinants of energy demand productions level productions risk and energy usage efficiency Particular attention is paid to the factors that enhance production risk or increase variations in energy input during production A dynamic panel model is specified and applied to 25 Korean industrial sectors over the period 1970 2007 The determinants of energy usage are identified and their effects in the form of elasticities of energy usage are estimated In addition the structural changes in the energy demand pattern are explored Stochastic production technology is applied to create two primary models A production model where the energy usage is a determinant of output and an energy demand model based on an inverted factor demand model where demand is a key determinant of the level of energy usage The findings reveal that First there are large variations in the degree of overuse or inefficiency in energy usage among the individual industries and over time second ICT information and communication technology capital and labor are substituting energy third ICT capital and value added services are two input factors decreasing the variability of energy demand while non ICT capital material and labor are increasing the variability of energy demand Finally the results suggest that technical progress contributes more to the increase of mean of energy demand than to the reduction of the level of risk An emerging recommendation is that industries increase the level of ICT capital and digitalization and invest more in R D activities and value added services to reduce the uncertainty related to their demand for energy This study forms the structure of the demand for energy under stochastic production risk for the South Korean industrial sector Public research programs aimed at the industrial sector should be concerned about both mean and risk properties in research on new technologies and in the investigation of possible alternative energy inputs This book describes the state of the art in energy usage analysis and

production risk applying factor requirement methodology It will be of use as a main or supplementary text in the teaching of advanced graduate courses but also as a reference for those working on empirically advanced research The book is an important addition to the existing literature on industrial development with its focus on energy as a core production input
