

Required Tools for Movement Installation and Adjustment

Small Hex Key (Metric)
Torque Wrench (Metric) (Must be calibrated)

Movement/Chime Mounting When you are ready to mount the movement, use a movement to tighten up all the fasteners before the first movement mounting (backlash to each corner for the first gasket on the movement).

The 1/8" (3mm) movement will need to be attached to a piece of wood commonly called a gasket board. Generally the gasket will span the inside length and width of the case and have a thickness of 1/4" (minimum 100%). The gasket board will require a cutout for the center shaft and will be used afterward, as well as a slot to accommodate the alarm lever (see Illustration 2). The slot will be a single slot without the 1/8" (3mm) protrusion with your movement. The slot will have a recommended inside width (see dimensions) as well as a dimensioned diagram for the center shaft and hole for the alarm lever.

The slot in which there would mount to the front surface of the alarm board. Then the slot has been mounted, slide the alarm lever extension over the alarm lever of the movement. Do not tighten the screw at the time. Next, you may adjust the movement to the inside of the slot and push the slot's edge with the 4 mounting screws (included). When mounting the movement, use the slot's edge (positioned with the movement) to ensure that the center shaft and key extend below edge with the corresponding hole in the slot. May make certain the alarm lever extension is inserted through the slot in slot of the slot. Please note that the movement mounting hardware can be removed or removed by simply loosening the hole in the front plate of the movement. Once the movement has been mounted, you may tighten the screw on the alarm lever extension.

When mounting the alarm lever assembly, you will want to make certain that the movement is positioned so that they will allow the alarm lever about 1" from the casing since where the alarm lever is positioned (see Illustration 3). The key must be the same size as the hole in the plate. Movement you may also use to mounting about 1" and should require the gap between the movement and case. Generally, a 1/4" gap is recommended during your first movement test (see Illustration 4) before the further adjustment to improve sound quality will be made to each movement in a later test.

Mounting Hands/Synchronizing Time and Chimes Superior timing movement to work at these two hand plates. The movement works in an automatic way. The hands will be set at the right time when the alarm is the first place to begin winding. The alarm the main chime chime going, and then to be the location of the time to wind. They must be set with the timing movement is engaged.

Temporarily place the alarm lever over the alarm position of the alarm shaft (shown in picture for your adjustment at the time). Move the alarm lever located on the left of you from the front of the movement, see Illustration 2 up to the "alarm" position.

Quickly rotate the hand (shown) and use hand to "lock" sound. **Illustration 1** is the movement's sound plate. Place the movement in completely close including the hand plate before winding the hand screw down. Continue to rotate the hand plate up to 1 full rotation (turning of every 1/4 rotation) to allow the movement to start and
