

DRIVING THE TRACTOR

SELECTING TRAVEL SPEEDS

The tractor has eight forward gears and four reverse gears. These gears, together with the engine speeds that may be selected, allow the operator to choose fuel and speed for maximum economy and give full flexibility to meet varying work conditions. For example, for a given travel speed the operator may choose to work in a low gear at a high engine speed or in a higher gear at a lower engine speed. Engine working speeds may be varied anywhere between 1500 and 2500 rpm. Tractor travel speeds in various gears are given in the chart below.

Consult with the range and gear shift levers above range and gear positions, permitting selection of the proper speed for the work to be performed.

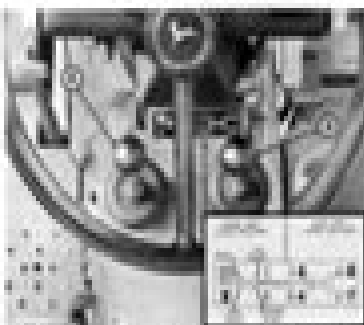

TRAVEL SPEEDS, MPH (kilometers/hour)
(Based on tractor speed with 11.5 ft
rear wheel)

Gear	Travel Speed in that gear (MPH)
Forward 1	1.2
2	1.7
3	2.8
4	3.8
5	4.8
6	6.8
7	8.8
8	10.8
Reverse 1	1.2
2	1.7
3	2.8
4	3.8

The tractor will operate most smoothly and efficiently at the engine speed of 1500 rpm. Using tractor on roads at lower or greater range speeds increases wear on all parts and will eventually result in unnecessary repair expense and increased operating efficiency.

An overworked tractor can usually be detected by gradual slowing down in road speed and slowing down and stopping of engine. Using more than the recommended amounts of fuel will also result in overworking the tractor and cause transmission damage.

SHIFTING GEARS

A - Range Shift Lever

B - Gear Shift Lever

Gear shifting is controlled by the range shift lever and gear shift lever. The range shift lever is located on the left side of the tractor and the gear shift lever is located on the right side of the tractor. The range shift lever is used to select low, first, second, third, fourth, fifth, sixth, seventh, eighth, and ninth gears. The gear shift lever is used to select first, second, third, fourth, fifth, sixth, seventh, eighth, and ninth gears. The range shift lever is in low range position when the range shift lever is in low range position. When the range shift lever is in high range position, when the range shift lever is in reverse range, reverse gears comparable to low, first, second, and third can be obtained.

The gear patterns are marked by a label on the transmission case cover.

NOTE: On tractors equipped with a reverse, the range shift lever does not have a reverse position. For location of the reverse, see page 6.

If equipped with a parking brake, the range shift lever does not have a park position.

Shifting From Park

To shift from park, fully depress the clutch pedal. Move the range shift lever from off park into range desired. Move gear shift lever into any gear desired. Once levers fully into position when gears are in use, stop.

NOTE: The gear shift lever must be in gear before the range shift lever is actuated.

The range shift lever must be out of park position before gear shift lever can be put into any gear desired.

Gradually release clutch pedal to take on load smoothly. Release parking brake, if equipped.

Shifting To Another Gear

By double clutching, you can shift gears within a range "on the go" to match the gear shifting. Double clutch, depress clutch pedal, shift to and release clutch pedal. Again depress clutch pedal to change gear, shift to gear desired.

Shifting To A Lower Gear: Fully stop the tractor and shift the range shift lever to the low range position before attempting to change the gear.

HIGH SPEED DRIVING

Use high speed fifth gear to save time in transport over highways and other smooth roads.

CAUTION: BE CAREFUL! Fuel saving is the cause of many accidents. On rough ground, shift down for safety.

PARKING THE TRACTOR

1. Completely stop the tractor.
2. Move the gear shift lever into any 1 through 8 gear position.
3. Move the range shift lever to park (P) position.
4. If equipped with a parking brake, apply brake firmly.

TOWING THE TRACTOR

When towing the tractor, move both the range and gear shift levers to the neutral position. This will prevent wear on transmission parts during towing.

IMPORTANT: Never tow the tractor at a speed greater than 15 miles per hour.

IMPORTANT: When towing or transporting the unit with the engine disengaged, ensure the exhaust stack runs up to the exhaust position. This will stop before starting engine after transporting.

REVERSE UNIT

The reverse unit allows the operator to change the direction of tractor travel "on the go" without double clutching or shifting gears.

A - Reverse

B - Reverse

A reverse control lever equipped with a neutral lock is located at the left side of the transmission case. The control lever has three positions: neutral, forward and reverse. When the lever is in the forward position, the tractor is in direct drive. When the lever is pulled backward, the tractor is in reverse drive. It is not necessary to depress or to shift gears when using the reverse lever. When the lever is in the neutral position, the neutral lock can be locked over the lever, keeping it in the lock.

IMPORTANT: Apply the reverse neutral lock whenever the reverse lever is in the neutral position.

IMPORTANT: The reverse gear ratio is such that reverse speeds are 10 percent higher than their respective forward speeds. Therefore use care when reversing direction, especially at higher travel speeds.
