are dis organized into the following chapters

Basics and Geometry This chapter covers a hodge podge collection of topics including GA forms for traditional vector identities Quaterions Cauchy equations Legendre polynomials wedge product representation of a plane bivector and trivector geometry torque and more A couple attempts at producing an introduction to GA concepts are included none of which I was ever happy with Projection Here the concept of reciprocal frame vectors using GA and traditional matrix formalisms is developed Projection rejection and Moore Penrose generalized inverse operations are discussed Rotation GA Rotors Euler angles spherical coordinates blade exponentials rotation generators and infinitesimal rotations are all examined from a GA point of view Calculus Here GA equivalents for a number of vector calculus relations are developed spherical and hyperspherical volume parameterizations are derived some questions about the structure of divergence and curl are examined and tangent planes and normals in 3 and 4 dimensions are examined Wrapping up this chapter is a complete GA formulation of the general Stokes theorem for curvilinear coordinates in Euclidean or non Euclidean spaces is developed

General Physics This chapter introduces a bivector form of angular momentum instead of a cross product examines the components of radial velocity and acceleration kinetic energy symplectic structure Newton s method and a center of mass problem for a toroidal segment

Relativity This is a fairly incoherent chapter including an attempt to develop the Lorentz transformation by requiring wave equation invariance Lorentz transformation of the four vector STA gradient and a look at the relativistic doppler equation

Electrodynamics The GA formulation of Maxwell s equation singular in GA is developed here Various basic topics of electrodynamics are examined using the GA toolbox including the Biot Savart law the covariant form for Maxwell s equation Space Time Algebra or STA four vectors and potentials gauge invariance TEM waves and some Lienard Wiechert problems Lorentz Force Here the GA form of the Lorentz force equation and its relation to the usual vectorial representation is explored This includes some application of boosts to the force equation to examine how it transforms under observe dependent conditions

Electrodynamic stress energy This chapter explores concepts of electrodynamic energy and momentum density and the GA representation of the Poynting vector and the stress energy tensors

Quantum Mechanics This chapter includes a look at the Dirac Lagrangian and how this can be cast into GA form Properties of the Pauli and Dirac bases are explored and how various matrix operations map onto their GA equivalents A bivector form for the angular momentum operator is examined A multivector form for the first few spherical harmonic eigenfunctions is developed A multivector factorization of the three and four dimensional Laplacian and the angular momentum operators are derived

Fourier treatments Solutions to various PDE equations are attempted using Fourier series and transforms Much of this chapter was exploring Fourier solutions to the GA form of Maxwell s equation but a few other non geometric algebra Fourier problems were also tackled
