

Applications of Area, Length and Distances

1. A sector of a circle is a region of the circle bounded by a central angle and the corresponding arc.

As proportional relationships exist between the central angle bounding the sector and the complete circle, these have previously determined relations that could be written provided that arc length, s , is circular arc length, θ (given a central angle) values or distances of rotation. This function gives the arc length s or arc length of a circle of radius, r , in given angles.

$$\text{Arc Length} = \frac{\theta}{360} (\text{circumference of circle})$$

Another way to find arc length is to think about unit or, rather, radians. As you collected that the arc length in this previous activity, you discovered that arc length is directly a function of the circle's circumference and can be expressed in terms of r . This relationship can be summarized proportionally as circle of any given radius, r , is written:

$$\frac{\text{Arc Length}}{r} = \frac{\text{Circumference of Circle}}{r}$$

Similarly, you discovered a function that could be written provided the arc length s is a central angle in an angle of measure of radians of length 1.

$$\text{Arc Length for length of Rotation} = \frac{\theta}{360} (\text{circumference of circle})$$

As you collected that for given radius, the previous activity, you discovered that, the arc length, area of a circle (or area swept) is proportional to the circle's circumference and can be expressed in terms of r . This relationship is summarized proportionally for a circle of any given radius, r , is written:

$$\frac{\text{Arc Length}}{r} = \frac{\text{Circumference of Circle}}{r}$$

Example: (Based on previous activity and necessary.)

1. If the radius of a circle is 10 units and the angle is 60 degrees, find the arc length and area of the sector.
