

Flash Programming via MDIO—Protocol Type 8

by Eckart Hartmann

INTRODUCTION

This application note describes a protocol proposed for fully integrated single package parts that incorporate high performance analog peripherals together with digital peripherals controlled by an ARM® Cortex™-M3 processor and integral flash for code and data.

The parts must include an MDIO interface capable of operating at up to 4 MHz and the capability to simultaneously execute from one flash block and to write/erase the other flash block making it ideal for 40 G to 100 G optical applications.

The nonerasable kernel code plus flags in user flash provide assistance to allow user code to robustly switch between the two blocks of user flash code and data spaces as required for MDIO.

For further details regarding the flags and other part specific details, consult the specific part hardware reference manual.

The purpose of this application note is to specify a flash procedure for initial programming of the user flash memory with only the power, GND, MDIO, and MDC pins accessible. The MDIO pin is in push-pull mode and does not require an external pull-up. The programming sequence can be initiated and controlled by a host.

For details about the MDIO protocol, refer to the MDIO specification IEEE 802.3 and the specific Analog Devices, Inc., device hardware reference manual. Protocol Type 8 only implements the minimum frame types necessary to perform downloads and relies entirely on the verify mechanism described in this application note to check that the download was successful. For in-service reprogramming, one can devise and implement their own reprogramming strategy.
