Hypersonic and High-temperature Gas Dynamics John David Anderson,2006 This book is the second edition of a successful self contained text for those students and readers interested in learning hypersonic flow and high temperature gas dynamics Like the first edition it assumes no prior familiarity with either subject on the part of the reader If you have never studied hypersonic and or high temperature gas dynamics before and if you have never worked extensively in the area then this book is for you On the other hand if you have worked and or are working in these areas and you want a cohesive presentation of the fundamentals a development of important theory and techniques a discussion of the salient results with emphasis on the physical aspects and a presentation of modern thinking in these areas then this book is also for you In other words this book is designed for two roles 1 as an effective classroom text that can be used with ease by the instructor and understood with ease by the student and 2 as a viable professional working tool for engineers scientists and managers who have any contact in their jobs with hypersonic and or high temperature flow Because of its success most of the first edition has been carried over to the second edition with the addition of much new material This second edition has updated figures

and data to complement the presentation and discussion of the fundamentals New to this edition are some educational tools that the author has found successful in previous books 1 previews of each chapter written in plain language to inform the reader why it is important to read and understand the material in the chapter to highlight the important aspects and to whip up the readers interest 2 design examples scattered throughout the book to illustrate the applic

Hypersonic and High-temperature Gas Dynamics , 2006
Gasdynamics of Explosions and Reactive Systems A. K. Oppenheim, 2013-10-22 Gas Dynamics of Explosions and

Reactive Systems documents the proceedings of the 6th Colloquium held at the Royal Institute of Technology in Stockholm Sweden 22-26 August 1977. The meeting was held under the auspices of the Royal Swedish Academy of Sciences and the International Academy of Astronautics. The scientific program included over one hundred papers. The contributions in this volume are organized into four parts. Part I contains papers on gaseous detonations. It covers topics such as theoretical model of a detonation cell, spherical detonations in hydrocarbon-air mixtures and shock wave propagation in tubes filled with water foams. Part II presents studies on explosions such as the detonation of hydrogen azide and propagation of a laser-supported detonation wave. Part III examines condensed phase detonations. It includes papers on the mechanism of the divergent and convergent shock waves originating at the charge boundary in detonating liquid homogeneous explosives with unstable detonation front and initiation studies in sensitized nitromethane. Part IV presents discussions on turbulent detonations covering topics such as the computational aspects of turbulent combustion and problems and techniques in turbulent reactive systems.

Introduction to Software for Chemical Engineers Mariano Martín Martín, 2014-07-01. The field of chemical engineering is in constant evolution and access to information technology is changing the way chemical engineering problems are addressed. Inspired by the need for a user-friendly chemical engineering text that demonstrates the real-world applicability of different computer programs.

Radiation Gas Dynamics Shih-I. Pai, 2012-12-06. When the temperature of a gas is not too high and the density of a gas is not too low, the transfer of heat by radiation is usually negligibly small in comparison with that by conduction and convection. However, in the hypersonic flow of space flight, particularly in the re-entry of a space vehicle and in the flow problem involving nuclear reaction such as in the blast wave of nuclear bomb or in the peaceful use of the controlled fusion reaction, the temperature of the gas may be very high and the density of the gas may be very low. As a result, thermal radiation becomes a very important mode of heat transfer. A complete analysis of such high-temperature flow fields should be based upon a study of the gasdynamic field and the radiation field simultaneously. Hence, during the last few years, considerable efforts have been made to study such interaction problems between gasdynamic field and radiation field, and a new title, *Radiation Gasdynamics*, has been suggested for this subject. Even though radiative transfer has been studied for a long time by astrophysicists, the interaction between the radiation field and the gasdynamic field has been only extensively studied recently.

Nuclear Science Abstracts, 1962. *Nonlinear Dynamic in Engineering by Akbari-Ganji's Method* Mohammadreza Akbari, Alireza

Ahmadi, Davood Domairry Ganji, 2015-11-10. In the present book, attempts have been made to conquer the difficulty of solving nonlinear differential equations, especially the highly nonlinear ones. A convenient approach, AGM (Akbari-Ganji's method), has been proposed to solve all the existing nonlinear ordinary differential equations up to now. Here, all the existing nonlinear ODEs have been divided into some categories, and for each of them, an innovative technique has been introduced to find their exact solution. Moreover, a suitable technique has been proposed to evaluate the precision of the acquired solution, which can

be utilized when there is not any exact solution and the problem is not solvable by numerical methods such as some kinds of inverse problems One of the significant nobilities of this book refers to the ability of AGM in solving partial differential equations in different aspects for instance fluid mechanics heat transfer and vibration as discussed in the sixth chapter Eventually we hope this book can be considered as a suitable guide for all the people who deal with nonlinear differential equations
