Embedded Operating System Projects Hentschel, Uwe, Richter, Daniel, Polze, Andreas, 2014 In today's life embedded systems are ubiquitous But they differ from traditional desktop systems in many aspects these include predictable timing behavior real time the management of scarce resources memory network reliable communication protocols energy management special purpose user interfaces headless operation system configuration programming languages to support software hardware co design and modeling techniques Within this technical report authors present results from the lecture Operating Systems for Embedded Computing that has been offered by the Operating Systems and Middleware group at HPI in Winter term 2013/14 Focus of the lecture and accompanying projects was on principles of real time computing Students had the chance to gather practical experience with a number of different OSes and applications and present experiences with near hardware programming Projects address the entire spectrum from bare metal programming to harnessing a real time OS to exercising the full software hardware co design cycle Three outstanding projects are at the heart of this technical report Project 1 focuses on the development of a bare metal operating system for LEGO Mindstorms EV3 While still a toy it comes with a powerful ARM processor 64 MB of main memory standard interfaces such as Bluetooth and network protocol stacks EV3 runs a version of Linux Sources are available from Lego's web site However many devices and their driver software are proprietary and not well documented Developing a new bare metal OS for the EV3 requires an understanding of the EV3 boot process Since no standard input output devices are available initial debugging steps are tedious After managing these initial steps the project was able to adapt device drivers for a few Lego devices to an extent that a demonstrator the Segway application could be successfully run on the new OS Project 2 looks at the EV3 from a different angle The EV3 is running a pretty decent version of Linux in principle the RT_PREEMPT patch can turn any Linux system into a real time OS by modifying the behavior of a number of synchronization constructs at the heart of the OS Priority inversion is a problem that is solved by protocols such as priority inheritance or priority ceiling Real time OSes implement at least one of the protocols The central idea of the project was the comparison of non real time and real time variants of Linux on the EV3 hardware A task set that showed effects of priority inversion on standard EV3 Linux would operate flawlessly on the Linux version with the RT_PREEMPT patch applied If only patching Lego's version of Linux was that easy Project 3 takes the notion of real time computing more seriously The application scenario was centered around our Carrera Digital 132 racetrack Obtaining position information from the track controlling individual cars detecting and modifying the Carrera Digital protocol required design and implementation of custom controller hardware What to implement in hardware firmware and what to implement

in application software this was the central question addressed by the project [The LEGO MINDSTORMS EV3 Laboratory](#) Daniele Benedettelli,2013-10-13 The LEGO MINDSTORMS EV3 set offers so many new and exciting features that it can be hard to know where to begin Without the help of an expert it could take months of experimentation to learn how to use the advanced mechanisms and numerous programming features In The LEGO MINDSTORMS EV3 Laboratory author Daniele Benedettelli robotics expert and member of the elite LEGO MINDSTORMS Expert Panel shows you how to use gears beams motors sensors and programming blocks to create sophisticated robots that can avoid obstacles walk on two legs and even demonstrate autonomous behavior You ll also dig into related math engineering and robotics concepts that will help you create your own amazing robots Programming experiments throughout will challenge you while a series of comics and countless illustrations inform the discussion and keep things fun As you make your way through the book you ll build and program five wicked cool robots ROV3R a vehicle you can modify to do things like follow a line avoid obstacles and even clean a room WATCHGOOZ3 a bipedal robot that can be programmed to patrol a room using only the Brick Program App no computer required SUP3R CAR a rear wheel drive armored car with an ergonomic two lever remote control SENTIN3L a walking tripod that can record and execute color coded sequences of commands T R3X a fearsome bipedal robot that will find and chase down prey With The LEGO MINDSTORMS EV3 Laboratory as your guide you ll become an EV3 master in no time
