Label the following diagram

Organisms have two copies of chromosomes in every cell. They come in pairs. Sometimes people have one extra chromosome and sometimes they have one missing.

Egg cells and sperm cells are called gametes. Each gamete contains half of the genetic information and all of the genes.

A gene is a section of DNA which codes for a specific characteristic, e.g. hair colour. Since we have two of each chromosome, we have two copies of each gene. These are called alleles. They get one from each parent.

They can be heterozygous: both alleles are the same or homozygous where both alleles are different.

Some genes are dominant and some are recessive. A dominant gene always expressed if present and a recessive gene only shows if there are two copies.

Phenotype is a description of the characteristics that are shown.

Genotype is a description of the exact combination of genes inherited.

Human hair is dominant over blonde (Bb). If my phenotype is brown, I have brown hair, my genotype could be BB (homozygous) or Bb (heterozygous).
