

to maintain a comfortable environment inside the house. By analyzing the heat transfer and air flow, we learn what heat transfer (and air flow) is required for the house to be a comfortable place. A thermodynamic analysis will tell us the conditions needed to maintain the temperature and relative humidity, and that analysis will tell us the size of the fan required to push the air in, the conditioner and the ducts needed to distribute the cooled air throughout the house.

Perhaps we want to focus on the air conditioner itself. Figure 1.2 is a schematic of two heat exchangers, a compressor, and a valve. A thermodynamic analysis would tell us how much energy is required to maintain a desired amount of cooling. A heat transfer analysis would tell us the size of the heat exchangers. The fluid dynamics analysis would tell us the pressure drops across the heat exchangers, as well as the required compressor flow.

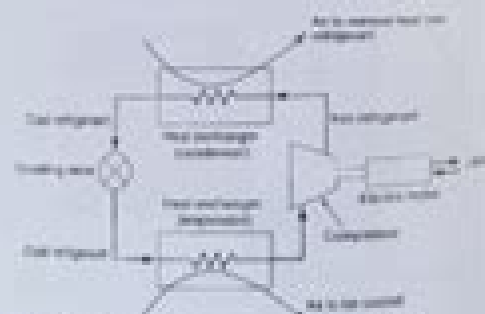

FIGURE 1.2 Schematic of a vapor-compression refrigeration cycle.

FIGURE 1.3 Schematic of a building showing heat transfer.

It is a simple task, however, a cooling system with a compressor (Figure 1.3). The compressor flow and power supply must be selected so that the refrigerant of the system is not compressed. This requires cooling approach is to have air through the compressor into the evaporator heat. A thermodynamic analysis of each heat exchanger and compressor will tell us the amount of energy that must be provided to maintain the compressor flow so that the temperature of the air entering the evaporator will not exceed a given limit. That analysis would tell us the size of the fan, the size of the cooling coil, and the size of the ducts needed to maintain the compressor at a safe temperature. Fluid dynamics will tell us the flow rate needed to flow air through the fan and ducts for air flow of the compressor and out of the evaporator coil.

1.2 THERMAL AND FLUID SYSTEMS ANALYSIS AND ENGINEERING

Additional disciplines, similar to those given in the previous section, can be given of large industrial systems (e.g., power plants, oil refineries, chemical processing plants) and related processes (e.g., heat treatment of metals). Heat propagation that would otherwise have thermodynamic, heat transfer, and fluid dynamics are all needed in many design fields. It is the integrated use of these three disciplines that is required for rational and complete analysis of many systems.

Whether the engineer is given an assignment to design a new device or modification to an existing process or to predict the performance of a device, the objectives of the design process must be very clear. Subsequent, which aspect of the device, process, or system in which to focus must be well defined. A systematic approach to the design analysis is needed. Figure 1.4 shows a flow diagram of the design process typically take when analyzing and engineering a thermal fluid system. We always begin with the physical system (e.g., the engine of a car). This is reality. The engineer's job is, first, to translate the physical system into a physical model and, second, to describe the physical model with a mathematical model. The actual physical system may be so complex that it is impossible to fully describe each part within process. However, we require that device as a model, a picture, or picture that we can use to describe and understand the system sufficiently so that it can be modeled. Once a physical model is developed, then physical laws that govern the process (e.g., a flow, momentum, mass, or energy balance) are used to create the

The Achievement Gap in Reading Rosalind Horowitz, S. Jay Samuels, 2017-04-07 In this volume prominent scholars experts in their respective fields and highly skilled in the research they conduct address educational and reading research from varied perspectives and address what it will take to close the achievement gap with specific attention to reading The achievement gap is redefined as a level at which all groups can compete economically in our society and have the literacy tools and habits needed for a good life Bringing valuable theoretical frameworks and in depth analytical approaches to interpretation of data the contributors examine factors that contribute to student achievement inside the school but which are also heavily influenced by out of school factors such as poverty and economics ethnicity and culture family and community stratifications and approaches to measurement of achievement These out of school factors present possibilities for new policies and practice The overarching theme is that achievement gaps in reading are complex and that multiple perspectives are necessary to address the problem The breadth and depth of perspectives and content in this volume and its conceptualization of the achievement gap are a significant contribution to the field
