covers supramolecular chemistry a field that originated from the work of researchers in organic inorganic and physical chemistry with some biological influence The original edition was structured to reflect in part the origin of the field However in the past two decades the field has changed a great deal as reflected in this new work that covers the general principles of supramolecular chemistry and molecular recognition experimental and computational methods in supramolecular chemistry supramolecular receptors dynamic supramolecular chemistry supramolecular engineering crystallographic engineered assemblies sensors imaging agents devices and the latest in nanotechnology Each section begins with an introduction by an expert in the field who offers an initial perspective on the development of the field Each article begins with outlining basic concepts before moving on to more advanced material Contains content that begins with the basics before moving on to more complex concepts making it suitable for advanced undergraduates as well as academic researchers Focuses on application of the theory in practice with particular focus on areas that have gained increasing importance in the 21st century including nanomedicine nanotechnology and medicinal chemistry Fully rewritten to make a completely up to date reference work that covers all the major advances that have taken place since the First Edition published in 1996 Redox-based Catalytic Chemistry of Transition Metal Complexes Takahiko Kojima, 2024-12-20 Transition metal complexes as catalysts play an indispensable role in transformation of chemical substances to value added products using less energy consuming processes and with high selectivity and efficiency In collaboration with the Japan Society of Coordination Chemistry JSCC the work is a translation of the original Japanese book focusing on metal complex catalysts that are effective in redox reactions and covers important reactions involving metal complex catalysts It describes not only what reactions proceed but also the intermediates they pass through and how the reactions proceed including computational chemistry approaches It allows you to gain a deeper understanding of the reaction mechanisms of metal complex catalysts The scope of this book includes oxidative reactions performed by high valent metal oxo species reductive reactions bond activation and bond formation and photocatalytic reactions Topics in this book will be interest to those studying catalytic chemistry and related fields including coordination chemistry organometallic chemistry organic chemistry bioinorganic chemistry and industrial chemistry The Biology of Caves and Other Subterranean Habitats David C. Culver, Tanja Pipan, 2019-04-01 The second edition of this widely cited textbook continues to provide a concise but comprehensive introduction to cave and subterranean biology describing this fascinating habitat and its biodiversity It covers a range of biological processes including ecosystem function evolution and adaptation community ecology biogeography and conservation The authors draw on a global range of examples and case studies from both caves and non cave subterranean habitats One of the barriers to the study of subterranean biology has been the extraordinarily large number of specialized terms used by researchers the authors explain these terms clearly and minimize the number that they use This new edition retains the same 10 chapter structure of the original but the content has been thoroughly revised and updated throughout to reflect the huge increase in publications concerning subterranean

Natural Product Biosynthesis Christopher T Walsh, Yi Tang, 2022-12-14 Authored by leading experts in the enzymology of natural product biosynthesis this completely revised and updated edition provides a description of the types of natural products the biosynthetic pathways that enable the production of these molecules and an update on the discovery of novel products in the post genomic era Although some 500 000 600 000 natural products have been isolated and characterized over the past two centuries there may be a 10 fold greater inventory awaiting immediate exploration based on biosynthetic gene cluster predictions The approach of this book is to codify the chemical logic that underlies each natural product structural class as they are assembled from building blocks of primary metabolism This second edition integrates many new findings into the sets of principles of the first edition that parsed categories of natural product chemistries into the underlying enzymatic mechanisms and the catalytic machinery for building the varied and complex end product metabolites New chapters include evaluation of a core set of thermodynamically activated but kinetically stable metabolites that power both primary and secondary metabolic pathways Also after decades of uncertainty about the existence of various pericyclase classes a series of genome mining heterologous expression and enzymatic activity characterization have validated a plethora of pericyclases over the past decade The several types of pericyclases are involved in biosynthetic complexity generation of almost every major category of natural products This text will serve as a reference point for chemists of every subdiscipline including synthetic organic chemists and medicinal chemists It will also be valuable to bioinformatic and computational biologists pharmacognocists and chemical ecologists and bioengineers and synthetic biologists
