Managing Information Security Christopher Day, 2013-08-21 With the increasing importance of information systems in today's complex and global economy it has become mission and business critical to defend those information systems from attack and compromise by any number of adversaries. Intrusion prevention and detection systems are critical components in the defender's arsenal and take on a number of different forms. Formally, intrusion detection systems (IDS) can be defined as software or hardware systems that automate the process of monitoring the events occurring in a computer system or network, analyzing them for signs of security problems. Intrusion prevention systems (IPS) are those that attempt to actually stop an active attack or security problem. While there are many IDS and IPS products on the market today, often sold as self-contained network attached computer appliances, truly effective intrusion detection and prevention is achieved when viewed as a process coupled with layers of appropriate technologies and products. In this chapter we will discuss the nature of computer system intrusions, those who commit these attacks, and the various technologies that can be utilized to detect and prevent them.

Managing Information Security James T. Harmening,2013-08-21 Today when most companies and government agencies rely on computer networks to store and manage their organizations data it is essential that measures are put in place to secure those networks and keep them functioning optimally Network administrators need to define their security management systems to cover all parts of their computer and network resources With a plethora of storage devices including iPads Android Tablets USB drives watches televisions Digital Video Recorders smart phones apple T V appliances Xbox s and household appliances the management becomes even more difficult This chapter focuses on security management systems

Which are sets of policies put place by an organization to maintain the security of their computer and network resources These policies are based on the types of resources that need to be secured and they depend on the organization Some groups of policies can be applied to entire industries others are specific to an individual organization A security management system starts as a set of policies that dictate the way in which computer resources can be used The policies are then implemented by the organization s technical departments and enforced This can be easy for smaller organizations but can require a team for larger international organizations that have thousands of business processes Either way measures need to be put in place to prevent respond to and fix security issues that arise in an organization Standards that were in place ten years ago may not be adequate for current business practices As an example a strong password may have included less than 8 characters while modern computers can easily break the password utilizing brute force or rainbow table methods
