guration or material forces in phenomena such as growth and remodelling is perhaps its greatest present day impetus While some excellent comprehensive works approaching the subject from different angles have been published the objective of this monograph is to present a point of view that emphasizes the different geometric aspects of inhomogeneity theory In so doing we follow the general lines of thought that we have propounded in many publications and presentations over the last two decades Although based on these sources this book is a stand alone entity and contains some new results and perspectives At the same time it does not intend to present either a historical account of the development of the subject or a comprehensive picture of the various schools of thought that can be encountered by perusing scholarly journals and attending specialized symposia The book is divided into three parts the first of which is entirely devoted to the formulation of the theory in the absence of evolution In other words time is conspicuously absent from Part I It opens with the geometric characterization of material inhomogeneity within the context of simple bodies in Chapter 1 followed by extensions to second grade and Cosserat media in Chapters 2 and 3
