Global Approaches to Early Learning Research and Practice Kenneth R. Pugh, Peggy McCardle, Annie Stutzman, 2018-02-26. The health, development, and learning of many young children living in disadvantage areas are at serious risk. Access to education has improved under the United Nations Millennium Development Goals, and there are now programs in low and middle income countries that are aimed at improving instruction and learning. The research and evaluation on the effectiveness of such programs show there are significant challenges but also some successes. This issue features presentations of leading international scientists, representatives from key governmental and non-governmental organizations, and others working with programs in the developing world and disadvantaged populations. The presentations describe the goals, existing challenges, and potential approaches to providing evidence-based programs to young children in rural, remote, and poverty-stricken areas. Topics covered include the state of early childhood in low and middle income nations, programs that have shown some success, and innovative research approaches that have been often considered unfeasible in these contexts. This is the 158th volume in the Jossey-Bass series *New Directions for Child and Adolescent Development*. Its mission is to provide scientific and scholarly presentations on cutting-edge issues and concepts in this subject area. Each volume focuses on a specific new direction or research topic and is edited by experts from that field.

Psychology and Mathematics Education Gila Hanna, Laura Macchi, Karin Binder, Laura Martignon, Katharina Loibl, 2023-09-05. Modern Mathematics is constructed rigorously through proofs based on truths which are either axioms or previously proven theorems. Thus it is par excellence a model of rational inquiry. Links between Cognitive Psychology and Mathematics Education have been particularly strong during the last decades. Indeed, the Enlightenment view of the rational human mind that reasons

makes decisions and solves problems based on logic and probabilities was shaken during the second half of the twentieth century Cognitive psychologists discovered that humans thoughts and actions often deviate from rules imposed by strict normative theories of inference Yet these deviations should not be called errors as Cognitive Psychologists have demonstrated these deviations may be either valid heuristics that succeed in the environments in which humans have evolved or biases that are caused by a lack of adaptation to abstract information formats Humans as the cognitive psychologist and economist Herbert Simon claimed do not usually optimize but rather satisfice even when solving problem This Research Topic aims at demonstrating that these insights have had a decisive impact on Mathematics Education We want to stress that we are concerned with the view of bounded rationality that is different from the one espoused by the heuristics and biases program In Simon s bounded rationality and its direct descendant ecological rationality rationality is understood in terms of cognitive success in the world correspondence rather than in terms of conformity to content free norms of coherence e g transitivity
