Line Graphs and Radiometric Dating

Scientists use line graphs as tools to communicate data, specifically to show how data changes over time. Line graphs make it easy to compare different sets of data over time. For example, in radiometric dating, the absolute age of rock is determined by comparing the relative percentages of a radioactive (parent) isotope and a stable (daughter) isotope.

Half-life is the time it takes for half of the mass of a radioactive isotope to decay into its daughter isotope. To make a line graph of the half-life of any radioactive isotope, plot the amount of the parent isotope against the amount of the daughter isotope over time. Even if you do not know the time periods for each half-life of a radioactive isotope, the relationship can still be plotted on a line graph.

For example, suppose the original mass of a radioactive isotope is 100 kg, or 100,000 g. A table showing the half-life for this amount of radioactive isotope would look like this:

Number of Half-Lives	Parent Isotope	Daughter Isotope	Number of Half-Lives	Parent Isotope	Daughter Isotope
0	100,000 g	0 g	3	12,500 g	87,500 g
1	50,000 g	50,000 g	4	6,250 g	93,750 g
2	25,000 g	75,000 g	5	3,125 g	96,875 g

The data from the table can be plotted in a line graph, which would look like this:

PRACTICE

Use the line graph to answer the following questions.

- How many half-lives have passed when there are three times as much daughter isotope as parent isotope?
