

Solving Word Problems Involving Logarithms

Scientists have found that the length in inches of a certain species of electric eel can be found by $L = 22.4 \ln w - 28.7$, where w is the eel's weight in pounds. Find the weight of an eel that is 4 feet long. Round your answer to the nearest tenth of a pound.

$$4 \cdot 12 = 48 \text{ inches}$$

___ lbs

$$\begin{array}{r} 48 = 22.4 \ln(w) - 28.7 \\ + 28.7 \quad \quad + 28.7 \end{array}$$

$$76.7 = 22.4 \ln(w).$$

Attacking Problems in Logarithms and Exponential Functions David S. Kahn, 2015-09-30 This original volume offers a concise highly focused review of what high school and beginning college students need to know in order to solve problems in logarithms and exponential functions Numerous rigorously tested examples and coherent to the point explanations presented in an easy to follow format provide valuable tools for conquering this challenging subject The treatment is organized in a way that permits readers to advance sequentially or skip around between chapters An essential companion volume to the author's *Attacking Trigonometry Problems* this book will equip students with the skills they will need to successfully approach the problems in logarithms and exponential functions that they will encounter on exams [The Bounded and Precise Word Problems for Presentations of Groups](#)

S. V. Ivanov, 2020-05-13 The author introduces and studies the bounded word problem and the precise word problem for groups given by means of generators and defining relations For example for every finitely presented group the bounded word problem is in NP i.e. it can be solved in nondeterministic polynomial time and the precise word problem is in PSPACE i.e. it can be solved in polynomial space The main technical result of the paper states that for certain finite presentations of groups which include the Baumslag Solitar one relator groups and free products of cyclic groups the bounded word problem and the precise word problem can be solved in polylogarithmic space As consequences of developed techniques that can be described as calculus of brackets the author obtains polylogarithmic space bounds for the computational complexity of the diagram problem for free groups for the width problem for elements of free groups and for computation of the area defined by polygonal singular closed curves in the plane The author also obtains polynomial time bounds for these problems *Precalculus with Calculus Previews* Wright, Dennis G. The Compressed Word Problem for Groups Markus Lohrey, 2014-04-04 The Compressed Word Problem for Groups provides a detailed exposition of known results on the compressed word problem emphasizing efficient algorithms for the compressed word problem in various groups The author presents the necessary background along with the most recent results on the compressed word problem to create a cohesive self contained book accessible to computer scientists as well as

mathematicians Readers will quickly reach the frontier of current research which makes the book especially appealing for students looking for a currently active research topic at the intersection of group theory and computer science The word problem introduced in 1910 by Max Dehn is one of the most important decision problems in group theory For many groups highly efficient algorithms for the word problem exist In recent years a new technique based on data compression for providing more efficient algorithms for word problems has been developed by representing long words over group generators in a compressed form using a straight line program Algorithmic techniques used for manipulating compressed words has shown that the compressed word problem can be solved in polynomial time for a large class of groups such as free groups graph groups and nilpotent groups These results have important implications for algorithmic questions related to automorphism groups
