Fleming,2006 Low or negative pressure transients also called surge or water hammer create temporary opportunities for external chemical and microbial contaminants at higher pressure to enter the water distribution system creating potential health hazard and potential weakening of distribution pipes leading to failure This study

investigates how such events as power outages pump shutdowns valve operations main flushing firefighting and main breaks can create significant rapid temporary drops in system pressure The report offers useful recommendations for using surge models to optimally locate pressure monitors and to minimize the occurrence and impact from low and negative pressure transients

Fluid Power Design Handbook, Third Edition Frank Yeaple, 1995-10-24 Maintaining and enhancing the high standards and excellent features that made the previous editions so popular this book presents engineering and application information to incorporate control predict and measure the performance of all fluid power components in hydraulic or pneumatic systems Detailing developments in the ongoing electronic revolution of fluid power control the third edition offers new and enlarged coverage of microprocessor control smart actuators virtual displays position sensors computer aided design performance testing noise reduction on screen simulation of complex branch flow networks important engineering terms and conversion units and more

Hydraulic design and management of wastewater transport systems Michiel Tukker, Kees Kooij, Ivo Pothof, 2016-04-15 Hydraulic Design and Management of Wastewater Transport Systems is a manual resulting from the research project CAPWAT CAPacity loss in wasteWATER pressure pipelines which researched the mechanisms for the creation stagnation and discharge of gas bubbles in wastewater pressure pipelines During this six year research programme it was recognised that there is no hydraulic manual guideline that focuses on the entire wastewater pressure pipeline system the processes it includes and the interaction between the pressure pipeline and the pumping station This manual provides a compilation of all the hydraulic knowledge that is necessary for designing a wastewater transport system and to manage it operationally The wastewater transport system is the link between the collection and treatment of the wastewater and the collection system includes among others the gravity flow sewage system from the house or consumer and service connection through street and main sewers up to the suction basins The transport system for which this manual was written includes the suction basin the sewage pumping station and the pressure pipelines Wastewater transport systems are becoming more complex due to building larger sewage water treatment plants wastewater being transported over greater distances and increasingly more and smaller pipelines connecting to the main sewers The operation of the pumping stations is largely determined by how the entire system behaves Insight into this operation is therefore crucial for proper design and management The central point of the design is to create an independent and safe system with the necessary transport capacity at minimum societal costs Predominantly the management aspect focuses on guidelines to maintain the design principles regarding capacity and required energy

Pathogen Intrusion Into the Distribution System Gregory J. Kirmeyer, 2001 Reports on a project that identifies pathogen routes of entry into water distribution systems and develops monitoring and control strategies for protecting the system Contains chapters on pathogens and pathways existing control strategies transient surge modeling pressure monitoring field monitoring recommended control strategies and recommendations to utilities The project was completed by a multi disciplinary team of engineers and practitioners with
