

Chapter 8 Microbial Genetics

- Big picture
 - Mutations can be caused by base substitutions or frameshift mutations
- Structure and Function of the Genetic Material
 - Genetics
 - The study of genes, how they carry information, how information is expressed, and how genes are replicated
 - Chromosomes
 - Structures containing DNA that physically carry hereditary information; the chromosomes contain genes
 - Genes
 - Segments of DNA that encode functional products, usually proteins
 - Genome
 - All the genetic information in a cell
 - The genetic code is a set of rules that determines how a nucleotide sequence is converted to an amino acid sequence of a protein
 - Central dogma
 - DNA → RNA → Protein
- Genotype and Phenotype
 - Genotype
 - The genetic makeup of an organism (represents potential expression)
 - Phenotype
 - Expression of the genes (represents actual expression)
- DNA and Chromosomes
 - Bacteria usually have single circular chromosomes made of DNA and associated proteins
 - The chromosome is looped and folded and attached at one or several points to the plasma membrane
 - DNA of E. coli has about 4.6 million base pairs and is about 1mm long (1000x longer than the entire cell).
 - Chromosomes take up only about 10% of the cell's volume because the DNA is twisted or supercoiled
- Organization
 - The entire genome does not consist of back-to-back genes. Noncoding regions, called short tandem repeats occur in most genomes. (Ex, E. Coli)
 - Short tandem repeats (STRs)
 - Repeating sequences of noncoding DNA
 - Can be used in DNA Fingerprinting
- Genomics
 - Complete base sequences of chromosomes can be determined
 - Computers are used to search for open reading frames (regions of DNA likely to encode a protein)
