

Variable	Method	How will it effect the rate of fall?
Surface area	This variable can be changed by making circles with different radius	The rate of decent should become faster as the surface area becomes smaller due to less air resistance
Mass	The mass of the parachute can be increased by adding extra weight	The larger the mass of the parachute the faster it should fall to the ground
Material	This can be changed by making parachutes with different materials	The type of material should effect the rate of decent and make it fall faster or slower
Height	The height from which the parachute is dropped	The higher the parachute is dropped from the ground the longer it should take to reach the ground. The lower it is dropped the faster it should reach the ground
Condition of environment	This can be changed by dropping the parachute in different conditions. i.e. windy	This should effect the descent of the parachute because there might be more or less wind or no wind at all

Galileo Probe Parachute Test Program Thomas N. Canning, 1988 The results of surveys of the near and far wake of the Galileo Probe are presented for Mach numbers from 0.25 to 0.95 The trends in the data resulting from changes in Mach number radial and axial distance angle of attack and a small change in model shape are shown in crossplots based on the data A rationale for selecting an operating volume suitable for parachute inflation based on low Mach number flight results is outlined

Kiker, WRIGHT AIR DEVELOPMENT CENTER WRIGHT-PATTERSON AFB OH., 1954 The purpose of the report is to present information and basic data concerning the parachutes used in the in flight approach control tests of a B 47 aircraft This program was established to provide the pilot with a device which would facilitate landings under marginal weather conditions and on airfields having short runways Author **Recreational Pilot**, 1997

Development of Methods for Assessment of Gliding Parachute Applications, 1982 In order to assess the possible utility of gliding parachutes it was necessary to develop a set of methods for predicting behavior of gliding parachutes The extent of agreement between simulation and flight data indicates that the primary factors included in the longitudinal stability analysis and in the 6DOF simulation are correct Although the stability analysis predicts only steady state behavior it forms the basis required for analysis of dynamic behavior in the body fixed XZ plane The agreement seen in descent rate would not be possible with an invalid stability model Of course in turning flight during the response immediately following the deflection other factors such as the assumed spanwise distribution of lift and drag become predominant The agreement in yaw rate best illustrates correctness of this aspect of the 6DOF model The mechanics driving motion during a spin are quite difficult to understand however the agreement shown in the descent rate indicates that the mass ratios assumed are accurate and further justifies the assumption of spanwise distribution of lift and drag In further development activities on

gliding parachute systems the 6DOF model will serve to guide exploratory work and will be updated for more accurate application to different canopies and to larger systems
