Problem 20D**CURRENT IN AND POTENTIAL DIFFERENCE ACROSS A RESISTOR****PROBLEM**

For the circuit from the previous section's sample problem, determine the current in and potential difference across the $8.0\ \Omega$ resistor (R_4) in the figure below.

**REASONING**

First find the equivalent resistance of the circuit. From this, determine the total circuit current. Then rebuild the circuit in steps, calculating the current and potential difference for the equivalent resistance of each group until the current in and potential difference across the specified $8.0\ \Omega$ resistor are known.

SOLUTION**1. Determine the equivalent resistance of the circuit.**

The equivalent resistance, which was calculated in the sample problem of the previous section, is $5.9\ \Omega$.

2. Calculate the total current in the circuit.

Substitute the potential difference and equivalent resistance in $\Delta V = IR$, and rearrange the equation to find the current delivered by the battery.

$$I = \frac{\Delta V}{R_{eq}} = \frac{(12.0\text{ V})}{(5.9\ \Omega)} = 2.0\text{ A}$$

3. Determine a path from the equivalent resistance found in step 1 to the specified resistor.

Review the path taken to find the equivalent resistance in the diagram below, and work backward through this path. The equivalent resistance for the entire circuit is the same as the equivalent resistance for group (c). The top resistors in group (c), in turn, form the equivalent resistance for group (b), and the rightmost resistor in group (b) is the specified $8.0\ \Omega$ resistor.
