## Chapter 13. THE COSTS OF PRODUCTION

### Solutions to Problems and Applications

1. a. opportunity cost; b. average total cost; c. fixed cost; d. variable cost; e. total cost; f. marginal cost.
2. a. The opportunity cost of something is what must be forgone to acquire it.  
b. The opportunity cost of running the hardware store is \$550,000, consisting of \$500,000 to rent the store and buy the stock and a \$50,000 opportunity cost, since your aunt would quit her job as an accountant to run the store. Since the total opportunity cost of \$550,000 exceeds revenue of \$510,000, your aunt should not open the store, as her profit would be negative—she would lose money.
3. a. Since you would have to pay for room and board whether you went to college or not, that portion of your college payment is not an opportunity cost.  
b. The explicit opportunity cost is the cost of tuition and books.  
c. An implicit opportunity cost is the cost of your time. You could work at a job for pay rather than attend college. The wages you give up represent an opportunity cost of attending college.
4. a. The following table shows the marginal product of each hour spent fishing:

Hours	Fish	Fixed Cost	Variable Cost	Total Cost	Marginal Product
0	0	\$10	\$0	\$10	—
1	10	10	5	15	10
2	18	10	10	20	8
3	24	10	15	25	6
4	28	10	20	30	4
5	30	10	25	35	2

- b. Figure 7 graphs the fisherman's production function. The production function becomes flatter as the number of hours spent fishing increases, illustrating diminishing marginal product.

**Business Cycles** Francis X. Diebold, Glenn D. Rudebusch, 2020-10-06 This is the most sophisticated and up to date econometric analysis of business cycles now available Francis Diebold and Glenn Rudebusch have long been acknowledged as leading experts on business cycles And here they present a highly integrative collection of their most important essays on the subject along with a detailed introduction that draws together the book's principal themes and findings Diebold and Rudebusch use the latest quantitative methods to address five principal questions about the

measurement modeling and forecasting of business cycles They ask whether business cycles have become more moderate in the postwar period concluding that recessions have in fact been shorter and shallower They consider whether economic expansions and contractions tend to die of old age Contrary to popular wisdom they find little evidence that expansions become more fragile the longer they last although they do find that contractions are increasingly likely to end as they age The authors discuss the defining characteristics of business cycles focusing on how economic variables move together and on the timing of the slow alternation between expansions and contractions They explore the difficulties of distinguishing between long term trends in the economy and cyclical fluctuations And they examine how business cycles can be forecast looking in particular at how to predict turning points in cycles rather than merely the level of future economic activity They show here that the index of leading economic indicators is a poor predictor of future economic activity and consider what we can learn from other indicators such as financial variables Throughout the authors make use of a variety of advanced econometric techniques including nonparametric analysis fractional integration and regime switching models Business Cycles is crucial reading for policymakers bankers and business executives **Agent-Based Computational Economics**

Shu-Heng Chen, 2017-09-19 This book aims to answer two questions that are fundamental to the study of agent based economic models what is agent based computational economics and why do we need agent based economic modelling of economy This book provides a review of the development of agent based computational economics ACE from a perspective on how artificial economic agents are designed under the influences of complex sciences experimental economics artificial intelligence evolutionary biology psychology anthropology and neuroscience This book begins with a historical review of ACE by tracing its origins From a modelling viewpoint ACE brings truly decentralized procedures into market analysis from a single market to the whole economy This book also reviews how experimental economics and artificial intelligence have shaped the development of ACE For the former the book discusses how ACE models can be used to analyse the economic consequences of cognitive capacity personality and cultural inheritance For the latter the book covers the various tools used to construct artificial adaptive agents including reinforcement learning fuzzy decision rules neural networks and evolutionary computation This book will be of interest to graduate students researching computational economics experimental economics behavioural economics and research methodology
