Multidimensional Curriculum Enhancing Future Thinking Literacy Hava E. Vidergor, 2018-07-17 This book presents an innovative Multidimensional Curriculum Model MdCM that develops future thinking literacy among all ages and levels of school students. It combines theory and practice and is highly applicable for policy makers, curriculum coordinators, lecturers at colleges of education, graduate students and teachers who are challenged daily to provide meaningful and up-to-date learning. It will aid teachers to prepare learners for the fast-changing world and equip them with skills that will help them control their futures. It combines latest teaching strategies of transdisciplinarity, phenomenon-based, project-based and problem-based learning in a unique manner so as to develop 21st-century skills. More specifically, it aims at developing higher-order thinking skills and processes referred to as scientific, creative and future thinking. It covers core and non-core curriculum domains, multi and transdisciplinary teaching as well as designing curricula for the gifted, the able and students at risk. It applies the latest theories on constructivism and carefully selected tools authentically and relevantly to create interest and challenge, addressing learning from personal, global and time perspectives. Each chapter highlights a strategy or thinking tool, commencing with theory followed by a unit description and lesson plans. The chapters each end with a final product named the future scenario. This scenario, written by students projecting themselves into the future, is based on accumulated knowledge, summarizes their learning and illustrates future thinking literacy.

Glasscock-Shambaugh Surgery of the Ear Lloyd B. Minor, Dennis Poe, 2010 Updated with new color graphics and new video CD of surgical and diagnostic procedures, this 6th edition retains its heritage as the classic textbook in otology and neurotology. Coverage includes scientific foundations and fundamentals, clinical evaluation and rehabilitation and sections on the external ear, inner ear, tympanomastoid compartment, internal auditory canal, Cerebellopontine angle, petrous apex and skull-based surgery. This edition integrates all the latest research in genetics, biotechnical advancements in laser and image-guided systems and clinical innovations and techniques of the past 7 years. Woven throughout is an intriguing historical overview of those who pioneered the early surgical interventions from 1950 to the present and the influences on current clinical practice. Editors of this edition, Julianna Gulya, Lloyd Minor and Dennis Poe, are internationally renowned figures in the field of otology and neurotology. This 6th edition enormously benefits from their editorial direction and wealth of knowledge and clinical expertise. SOTE 6 remains the classic text and reference of choice for otolaryngologists and neurosurgeons and an essential addition to the libraries of experienced surgeons, trainees or those preparing for board exams. New Chapters written by well-recognized leaders that include the latest research and clinical studies include Tumor Biology, Stereotactic Radiosurgery and Radiotherapy, Ossicular Reconstruction, Management of Cerebrospinal Fluid Leaks, Surgical Treatment of Peripheral Vestibular Disorders, Hearing Aids, Tinnitus, Rehabilitation, Vestibular Rehabilitation, Updated Temporal Bone Dissection Guide, Thymic Stromal Alterations and Genetic Disorders of Immune System.

Claudio Pignata, Ana E. Sousa, 2015-12-07 The

pathogenic mechanisms underlying primary T cell disorders are mainly related to molecular alterations of genes whose expression is intrinsic to hematopoietic cells. However, since the differentiation process requires a crosstalk among thymocytes and the thymic microenvironment, molecular alterations of genes involved in the differentiation and functionality of the stromal component of the thymus may lead to a severe T cell defect or failure of central tolerance as well. The first example of severe combined immunodeficiency (SCID) not related to an intrinsic alteration of the hematopoietic cell but rather of the thymic epithelial component is the Nude SCID phenotype, inherited as an autosomal recessive disorder whose hallmarks are the T cell defect and the absence of the thymus. The clinical and immunological phenotype is the human equivalent of the murine Nude SCID syndrome, which represents the first spontaneous SCID identified in nude mice in 1966. For over 3 decades, studies of the immune system in these mice enormously contributed to the overall knowledge of cell-mediated immunity in the assumption that the athymia of these mice was solely responsible for the T cell immunological defect. This syndrome is due to mutations of the transcription factor FOXP1, belonging to the forkhead box gene family, which is mainly expressed in the thymus and skin epithelial cells, where it plays a critical role in differentiation and survival. An alteration of the thymic structure is also a feature of the DiGeorge syndrome (DGS), which has been long considered the human counterpart of the nude mice phenotype. This syndrome is frequently associated to a deletion of the 22q11 region, which contains approximately 30 genes, including the TBX1 gene, which is responsible for most of the clinical features of DGS in humans and mice. In this syndrome, common manifestations are cardiac malformations, speech delay, hypoparathyroidism, and immunodeficiency, even though the immunological hallmarks of the T cell defect in DiGeorge syndrome are profoundly different from those reported in human Nude SCID. The divergence of the phenotype among these 2 entities raised the possibility that the FOXP1 transcription factor represents the real key stromal molecule implicated in directing the hematopoietic stem cell toward a proper T cell fate. The thymic stromal component of the primary lymphoid organ is also required to negatively select the autoreactive clones, a process driven by the expression of tissue-specific antigens (TSA) by medullary thymic epithelial cells (mTECs). The expression of genes encoding TSA antigens is mediated by the autoimmune regulator (AIRE) gene, encoding a transcription factor expressed in mTECs. Molecular alterations of this gene are associated to autoimmune polyendocrinopathy, candidiasis, ectodermal dystrophy (APECED), a rare autosomal disorder which may be considered the prototype of an autoimmune disease due to the failure of central tolerance homeostasis. All these experiments of nature led to unravel novel pathogenic mechanisms underlying inherited disorders of the immune system and of note to clarify the pivotal role of epithelial cells in the maturation and education process of T cell precursors.
