New Approaches for the Generation and Analysis of Microbial Typing Data L. Dijkshoorn, K.J. Towner, Mark J Struelens, 2001-07-10 Rapid molecular identification and typing of micro organisms is extremely important in efforts to monitor the geographical spread of virulent epidemic or antibiotic resistant pathogens It has become a mainstay of integrated hospital infection control service In addition numerous industrial and biotechnological applications require the study of the diversity of organisms Conventional phenotypic identification and typing methods have long been the mainstay of microbial population and epidemiological studies but such methods often lack adequate discrimination and their use is normally confined to the group of organisms for which they were originally devised Molecular fingerprinting methods have flourished in recent years and many of these new methods can be applied to numerous different organisms for a variety of purposes Standardisation of these methods is vitally important In addition the generation of large numbers of complex fingerprint profiles requires that a computer assisted strategy is used for the formation and analysis of databases The

purpose of this book is to describe the best fingerprinting methods that are currently available and the computer assisted strategies that can be used for analysis and exchange of data between laboratories This book is dedicated to the memory of Jan Ursing 1926 2000 Swedish microbiologist taxonomist and philosopher taxonomy is on the borders of philosophy because we do not know the natural continuities and discontinuities
