Derek Hodson, 2009-01-01 Findings generated by recent research in science education international debate on the guiding purposes of science education and the nature of scientific and technological literacy official and semi-official reports on science education including recommendations from prestigious organizations such as AAAS and UNESCO and concerns expressed by scientists environmentalists and engineers about current science education provision and the continuing low levels of scientific attainment among the general population have led to some radical rethinking of the nature of the science

curriculum There has been a marked shift of rhetorical emphasis in the direction of considerations of the nature of science model based reasoning inquiry based learning scientific argumentation and the use of language rich learning experiences reading writing talking to enhance concept acquisition and development These findings arguments and pronouncements seem to point very clearly in the direction of regarding science education as a study of scientific practice This book presents a comprehensive research based account of how such a vision could be assembled into a coherent curriculum and presented to students in ways that are meaningful motivating and successful The author takes what might be described as an anthropological approach in which scientists are studied as a socially economically and politically important community of people This group has its own distinctive language body of knowledge investigative methods history traditions norms and values each of which can be studied explicitly systematically and reflectively This particular approach was chosen for the powerful theoretical overview it provides and for its motivational value especially for students from sociocultural groups currently under served by science education and under represented in science The book which is both timely and important is written for teachers student teachers graduate students in education teacher educators curriculum developers and those responsible for educational policy It has the potential to impact very substantially on both pre service and inservice science teacher education programmes and to shift school science education practice strongly in the direction currently being advocated by prominent science educators

Redesigning Life John Parrington, 2016-08-18 Since the birth of civilisation human beings have manipulated other life forms We have selectively bred plants and animals for thousands of years to maximise agricultural production and cater to our taste in pets The observation of the creation of artificial animal and plant variants was a key stimulant for Charles Darwin's theory of evolution The ability to directly engineer the genomes of organisms first became possible in the 1970s when the gene for human insulin was introduced into bacteria to produce this protein for diabetics At the same time mice were modified to produce human growth hormone and grew huge as a result But these were only our first tottering steps into the possibilities of genetic engineering In the past few years the pace of progress has accelerated enormously We can now cut and paste genes using molecular scissors with astonishing ease and the new technology of genome editing can be applied to practically any species of plants or animals Mutation chain reaction can be used to alter the genes of a population of pests such as flies as the modified creatures breed the mutation is spread through the population so that within a few generations the organism is almost completely altered At the same time scientists are also beginning to synthesize new organisms from scratch These new technologies hold much promise for improving lives Genome editing has already been used clinically to treat AIDS patients by genetically modifying their white blood cells to be resistant to HIV In agriculture genome editing could be used to engineer species with increased food output and the ability to thrive in challenging climates New bacterial forms may be used to generate energy But these powerful new techniques also raise important ethical dilemmas and potential dangers pressing issues that are already upon us given the speed of scientific

developments To what extent should parents be able to manipulate the genetics of their offspring and would designer babies be limited to the rich Can we effectively weigh up the risks from introducing synthetic lifeforms into complex ecosystems In this extensively revised paperback edition John Parrington explains the nature and possibilities of these new scientific developments which could usher in a brave new world We must rapidly come to understand its implications if we are to direct its huge potential to the good of humanity and the planet
