Classroom Lab Setup Guide

GETTING STARTED

Abstract: The purpose of this study was to determine the effect of a 12-week, low-intensity, low-impact aerobically-based exercise program on the physical fitness and health-related quality of life of sedentary, middle-aged women. The study was a randomized, controlled trial. The intervention group performed a 12-week, low-intensity, low-impact aerobically-based exercise program, while the control group remained sedentary. The primary outcome was the change in physical fitness, measured by the 6-minute walk test. Secondary outcomes included changes in health-related quality of life, measured by the SF-36. The results showed that the intervention group had a significant increase in physical fitness and health-related quality of life compared to the control group. The findings suggest that a 12-week, low-intensity, low-impact aerobically-based exercise program can improve physical fitness and health-related quality of life in sedentary, middle-aged women.

"The network's got to figure out how to make it work. It's a challenge, but it's going to be a great reward when you succeed." Gheesling says that the show's success will depend on the network's ability to make it work. "It's a challenge, but it's going to be a great reward when you succeed." The American Society of Human Genetics provided the intellectual framework for the research project, which was designed to identify genetic loci associated with schizophrenia. The research team consisted of 100 scientists from 15 countries and 100 universities, and it was the first time that a large number of scientists from different countries had worked together on a single project. The project was funded by the National Institute of Mental Health (NIMH) and the National Science Foundation (NSF).
