Baker,G. Monegato,G. vanden Berghe,2001-06-20 homepage sac cam na2000 index html7 Volume Set now available at special set price This volume contains contributions in the area of differential equations and integral equations Many numerical methods have arisen in response to the need to solve real life problems in applied mathematics in particular problems that do not have a closed form solution Contributions on both initial value problems and boundary value problems in ordinary differential equations appear in this volume Numerical methods for initial value problems in ordinary differential equations fall naturally into two classes those which use one starting value at each step one step methods and those which are based on several values of the solution multistep methods John Butcher has supplied an expert s perspective of the development of numerical methods for ordinary differential equations in the 20th century Rob Corless and Lawrence Shampine talk about established technology namely software for initial value problems using Runge Kutta and Rosenbrock methods with interpolants to fill in the solution between mesh points but the slant is new based on the question How should such software integrate into the current generation of Problem Solving Environments Natalia Borovykh and Marc Spijker study the problem of establishing upper bounds for the norm of the nth power of square matrices The dynamical system viewpoint has been of great benefit to ODE theory and numerical methods Related is the study of chaotic behaviour Willy Govaerts discusses the numerical methods for the computation and continuation of equilibria and bifurcation points of equilibria of dynamical systems Arieh Iserles and

Antonella Zanna survey the construction of Runge Kutta methods which preserve algebraic invariant functions Valeria Antohe and Ian Gladwell present numerical experiments on solving a Hamiltonian system of H non and Heiles with a symplectic and a nonsymplectic method with a variety of precisions and initial conditions Stiff differential equations first became recognized as special during the 1950s In 1963 two seminal publications laid to the foundations for later development Dahlquist s paper on A stable multistep methods and Butcher s first paper on implicit Runge Kutta methods Ernst Hairer and Gerhard Wanner deliver a survey which retraces the discovery of the order stars as well as the principal achievements obtained by that theory Guido Vanden Berghe Hans De Meyer Marnix Van Daele and Tanja Van Hecke construct exponentially fitted Runge Kutta methods with s stages Differential algebraic equations arise in control in modelling of mechanical systems and in many other fields Jeff Cash describes a fairly recent class of formulae for the numerical solution of initial value problems for stiff and differential algebraic systems Shengtai Li and Linda Petzold describe methods and software for sensitivity analysis of solutions of DAE initial value problems Again in the area of differential algebraic systems Neil Biehn John Betts Stephen Campbell and William Huffman present current work on mesh adaptation for DAE two point boundary value problems Contrasting approaches to the question of how good an approximation is as a solution of a given equation involve i attempting to estimate the actual error i e the difference between the true and the approximate solutions and ii attempting to estimate the defect the amount by which the approximation fails to satisfy the given equation and any side conditions The paper by Wayne Enright on defect control relates to carefully analyzed techniques that have been proposed both for ordinary differential equations and for delay differential equations in which an attempt is made to control an estimate of the size of the defect Many phenomena incorporate noise and the numerical solution of   *Applications of Nonstandard Finite Difference Schemes* Ronald E. Mickens,2000 The main purpose of this book is to provide a concise introduction to the methods and philosophy of constructing nonstandard finite difference schemes and illustrate how such techniques can be applied to several important problems Chapter I gives an overview of the subject and summarizes previous work Chapters 2 and 3 consider in detail the construction and numerical implementation of schemes for physical problems involving convection diffusion reaction equations that arise in groundwater pollution and scattering of electromagnetic waves using Maxwell s equations Chapter 4 examines certain mathematical issues related to the nonstandard discretization of competitive and cooperative models for ecology The application chapters illustrate well the power of nonstandard methods In particular for the same accuracy as obtained by standard techniques larger step sizes can be used This volume will satisfy the needs of scientists engineers and mathematicians who wish to know how to construct nonstandard schemes and see how these are applied to obtain numerical solutions of the differential equations which arise in the study of nonlinear dynamical systems modeling important physical phenomena   **Mathematical Aesthetic Principles/nonintegrable Systems** Murray Muraskin,1995-05-09 Mathematical aesthetics is not discussed as a separate

discipline in other books than this even though it is reasonable to suppose that the foundations of physics lie in mathematical aesthetics This book presents a list of mathematical principles that can be classified as aesthetic and shows that these principles can be cast into a nonlinear set of equations Then with this minimal input the book shows that one can obtain lattice solutions soliton systems closed strings instantons and chaotic looking systems as well as multi wave packet solutions as output These solutions have the common feature of being nonintegrable i e the results of integration depend on the integration path The topic of nonintegrable systems has not been given much attention in other books Hence we discuss techniques for dealing with such systems   Resources in Education ,1997
