Mokarem, 2006 Pavement surface texture is measured in a variety of ways in Virginia Two methods commonly used are ASTM E 965 Standard Test Method for Measuring Pavement Macrottexture Depth Using a Volumetric Technique known as the sand patch test and ASTM E 2157 Standard Test Method for Measuring Pavement Macrottexture Properties Using the Circular Track CT Meter In September 2005 staff from the Virginia Transportation Research Council inquired about using the Digital Surface Roughness Meter DSRM to measure the surface texture of several concrete and asphalt surfaces Measurements were taken on concrete and asphalt surfaces using the DSRM CT meter and sand patch test and the results were compared From the data obtained there appears to be a good correlation among the results of the three methods The DSRM and sand patch tests appear to be more accurate on surfaces that are not uniform However this may be because the center of the rotating arm of the CT meter may have missed particular non uniform areas on the testing surface The use of the DSRM and CT meter devices also

reduces the probability of human error The sand patch test is exposed to a greater probability of human error it is a test that cannot be performed quickly without comprising accuracy The DSRM is a better device to use under a time constraint
