A 7 year old male is referred to the school clinic because he fainted on the playground. His height is 3 feet, 7 inches (107.5 cm), he weighs 55 pounds (25 kilograms), and his body mass index (BMI) is 20.9. Which assessment finding is most important for the RN to address?

- A. Explain that the child is likely to grow into her weight.
- B. Determine the child's usual physical activity pattern.
- C. Obtain the child's 3- day diet history based on the mother's input.
- D. Inquire as to whether or not the school has a physical education program.

(A) Does not consider the serious health and psychological consequences associated with childhood obesity. Girls do not hit their growth spurt before boys in preadolescence, but this child is only 6 years of age and the child's obesity should not be negated because of this growth and development expectation. (e)
