The linguistic model as defined in the Meaning Text Theory (MTT) is, first of all, a language production model. This makes MTT especially suitable for language engineering tasks related to synthesis: text generation, summarization, paraphrasing, speech generation, and the like. In this article, we focus on text generation. Large scale text generation requires substantial resources, namely grammars and lexica. While these resources are increasingly compiled for high density languages, for low- and middle density languages often no generation resources are available. The question on how to obtain them in a most efficient way becomes thus imminent. In this article, we address this question for MTT-oriented text generation resources.

## 1. Introduction

With the progress of the state of the art in Computational Linguistics and Natural Language Processing, language engineering has become an increasingly popular and pressing task. This is in particular true for applications in which text synthesis constitutes an important part – among other things, automatic text generation, summarization, paraphrasing, and machine translation.

Large coverage text synthesis in general requires substantial resources for each of the languages involved. While for high density languages, more and more resources are available, many of the low- and middle density languages are still not covered. This may be due to the lack of reference corpora, the lack of specialists knowledgeable in the field and in the language in question, or other circumstances. The question which must obviously be answered when a text synthesis application is to be realized for a low- or middle density language for which no text synthesis resources are available as yet: How can these resources be obtained in the most rapid and efficient way? This obviously depends on the exact kind of resources needed and thus, to a major extent, on the application and the linguistic framework underlying the implementation of the given system that addresses the application.

In this article, we focus on one case of text synthesis: the natural language text generation. We discuss the types of resources required for a text generator based on the *Meaning Text Theory*, MTT [1, 2, 3, and 4]. MTT is one of the most common rule-based linguistic theories used for text generation. This is not by chance: MTT's model is synthesis (rather than analysis, or parsing) oriented and it is formal enough to allow

**Semantics** Igor Mel'čuk, Jasmina Milićević, 2020-04-02 This book is an advanced introduction to semantics that presents this crucial component of human language through the lens of the Meaning Text theory an approach that treats linguistic knowledge as a huge inventory of correspondences between thought and speech Formally semantics is viewed as an organized set of rules that connect a representation of meaning Semantic Representation to a representation of the sentence Deep Syntactic Representation The approach is particularly interesting for computer assisted language learning natural language processing and computational lexicography as our linguistic rules easily lend themselves to formalization and computer applications The model combines abstract theoretical constructions with numerous linguistic descriptions as well as multiple practice exercises that provide a solid hands on approach to learning how to describe natural language semantics

Semantics Igor Mel'čuk, 2015-01-14 This book presents an innovative and novel approach to linguistic semantics starting from the idea that language can be described as a mechanism for the expression of linguistic Meanings as particular surface forms or Texts Semantics is specifically that system of rules that ensures a transition from a Semantic Representation of the Meaning of a family of synonymous sentences to the Deep Syntactic Representation of a particular sentence Framed in the terms of Meaning Text linguistics the present volume closes the publication of the three volume series It discusses in detail several linguistic notions crucial to the development of Meaning Text models of natural languages semantic and syntactic actants government pattern lexical functions linguistic connotations phrasemes the meaning of grammatical cases and linguistic dependencies The notions under analysis are illustrated from a variety of languages Reflecting the author's life long dedication to the study of the semantics and syntax of natural language this book is a paradigm shifting contribution to the language sciences whose originality and daring will make it essential reading for linguists anthropologists semioticians and computational linguists **Meaning-text Theory** Valentina Apresjan, 2013 **Selected Lexical and Grammatical Issues**

**The theory and practice of examples in bilingual dictionaries** Alfonso Rascón Caballero, 2024-07-22 The dictionary example is the culminating component of the information presented in articles of dictionaries intended for language learning This study analyses the example comprehensively its provenance its theoretical status its distinction from multiword lexical units to be presented as infralemmas types and specific functions The example not only illustrates the data provided by the definition the equivalent the grammatical collocational and pragmatic items but also provides valuable complementary information on the use of each lexical unit described Examples are models with which users can form other sentences but are also instantiations of the language that escape systematicity and reflect unpredictable but real uses Theoretical reflection on the theory of the example with special emphasis on the bilingual analysis of how especially bilingual dictionaries present examples and what kind of information each type of example

provides can assist lexicographers in planning their dictionaries and making theoretically based choices when it comes to the selection and presentation of examples      *Computational Dependency Theory* Eva Hajicová, Leo Wanner, 2013-12-03

Dependencies directed labeled graph structures representing hierarchical relations between morphemes words and semantic units are the standard representation in many fields of computational linguistics The linguistic significance of these structures often remains vague however and those working in the field stress the need for the development of a common notational and formal basis Although dependency analysis has become quasi hegemonic in Natural Language Processing NLP the connection between computational linguistics and dependency linguists remains sporadic But theoretical dependency linguists and computational linguists have much to share This book presents papers from the International Conference on Dependency Linguistics Depling 2011 held in Barcelona Spain in September 2011 Beginning with what may be the first formal definition of dependency structure the book continues with papers covering subjects such as the interface of the syntactic structures with semantics mapping semantic structures to text surface by means of statistical language generation formalization of dependency advances in dependency parsing and the link between statistical and rule based dependency parsing This comprehensive collection gives a coherent overview of recent advances in the interplay of linguistics and natural language engineering around dependency grammars ranging from definitional challenges of syntactic functions to formal grammars tree bank development and parsing issues      **Aspects of the Theory of Morphology** Igor Mel'cuk, 2008-08-22

The book is dedicated to linguistic morphology and it contains a sketch of a complete morphological theory centered around a discussion of fundamental concepts such as morph vs morpheme inflectional category voice grammatical case agreement vs government suppletion relationships between linguistic signs etc the hottest issues in modern linguistics The book introduces rigorous and clear concepts necessary to describe morphological phenomena of natural languages Among other things it offers logical calculi of possible grammemes in a given category The presentation is developed in a typological perspective so that linguistic data from a large variety of languages are described and analyzed about 100 typologically very different languages The main method is deductive the concepts proposed in Aspects of the Theory of Morphology are based on a small set of indefinibilia and each concept is defined in terms of these indefinibilia and or other concepts defined previously as a result logical calculi can be constructed similar to Mendeleev s Periodical Table of Elements in chemistry Then the concept is applied to the actual linguistic data to demonstrate its validity and advantages Thus Aspects of the Theory of Morphology combines metalinguistic endeavor a system of concepts for morphology with typological and descriptive orientation It reaches out to all students of language including the border fields and applications      **The International Encyclopedia of Communication Theory and Philosophy, 4 Volume Set** Klaus Bruhn Jensen, Robert T.
