

## Additive Manufacturing [3D printing] [Rapid prototyping]

### Definition:

It is a process of converting a Computer Aided Design (CAD) based three dimensional model into real product by layer wise processing of the 3-D model.

The process makes use of interfaced software and hardware components with actuators and sensors to print the 3-D product.

### Advantages over traditional manufacturing: (subtractive manufacturing)

- Reduces material wastage
- Reduces the number of operations and tooling
- Reduces the requirement of skilled operators (As it avoids use of multiple machine operations).
- Reduces production time
- Reduce cost of production as wastage is reduced
- Provides more freedom for designers.
- Complex parts can be produced

### Steps in Additive manufacturing: 8 steps. Detailing not needed

Printable 3D models can be created with a Computer Aided Design (CAD) package, through a 3D scanner, or by plain digital camera and photogrammetry software. These models can be saved in STEREO LITHOGRAPHY (STL) file format. This will be processed by software 'slicer' which converts the model into a series of thin layers and produces G-code program to a specific type of 3D printer.

Fluid-Structure-Sound Interactions and Control Yu Zhou, Yang Liu, Lixi Huang, Dewey H. Hodges, 2013-11-12 With rapid economic and industrial development in China India and elsewhere fluid related structural vibration and noise problems are widely encountered in many fields just as they are in the more developed parts of the world causing increasingly grievous concerns Turbulence clearly has a significant impact on many such problems On the other hand new opportunities are emerging with the advent of various new technologies such as signal processing flow visualization and diagnostics new functional materials sensors and actuators etc These have revitalized interdisciplinary research activities and it is in this context that the 2nd symposium on fluid structure sound interactions and control FSSIC was organized Held in Hong Kong May 20 21 2013 and Macau May 22 23 2013 the meeting brought together scientists and engineers working in all related branches from both East and West and provided them with a forum to exchange and share the latest progress ideas and advances and to chart the frontiers of FSSIC The Proceedings of the 2nd Symposium on Fluid Structure Sound Interactions and Control largely focuses on advances in the theory experimental research and numerical simulations of turbulence in the contexts of flow induced vibration noise and their control This includes several practical areas for interaction such as the aerodynamics of road and space vehicles marine and civil engineering nuclear reactors and biomedical science etc One of the particular features of these proceedings is that it integrates acoustics with the study of flow induced vibration which is not a common practice but is scientifically very helpful in understanding simulating and controlling vibration This offers a broader

view of the discipline from which readers will benefit greatly These proceedings are intended for academics research scientists design engineers and graduate students in engineering fluid dynamics acoustics fluid and aerodynamics vibration dynamical systems and control etc Yu Zhou is a professor in Institute for Turbulence Noise Vibration Interaction and Control at Harbin Institute of Technology Yang Liu is an associate professor at The Hong Kong Polytechnic University Lixi Huang associate professor works at the University of Hong Kong Professor Dewey H Hodges works at the School of Aerospace Engineering Georgia Institute of Technology
