Walsh,2017-08-17 Since its origin in the early 20th century the Modern Synthesis theory of evolution has grown to become the orthodox view on the process of organic evolution Its central defining feature is the prominence it accords to genes in the explanation of evolutionary dynamics Since the advent of the 21st century however the Modern Synthesis has been subject to repeated and sustained challenges These are largely empirically driven In the last two decades evolutionary biology has witnessed unprecedented growth in the understanding of those processes that underwrite the development of organisms and the inheritance of characters The empirical advances usher in challenges to the conceptual foundations of evolutionary theory The extent to which the new biology challenges the Modern Synthesis has been the subject of lively debate Many current commentators charge that the new biology of the 21st century calls for a revision extension or wholesale rejection of the Modern Synthesis Theory of evolution Defenders of the Modern Synthesis maintain that the theory can accommodate the exciting new advances in biology The original essays collected in this volume survey the various challenges to the Modern Synthesis arising from the new biology of the 21st century The authors are evolutionary biologists philosophers of science and historians of biology from Europe and North America Each of the essays discusses a particular challenge to the Modern Synthesis treatment of inheritance development or adaptation Taken together the essays cover a spectrum of views from those that contend that the Modern Synthesis can rise to the challenges of the new biology with little or no revision required to those that call for the abandonment of the Modern Synthesis The collection will be of interest to researchers and students in evolutionary biology and the philosophy and history of the biological sciences      Sea and Land Philip D. **Statistical Learning in Genetics** Daniel Sorensen, 2023-09-19 This book provides an introduction to computer based methods for the analysis of genomic data Breakthroughs in molecular and computational biology have contributed to the emergence of vast data sets where millions of genetic markers for each individual are coupled with medical records generating an unparalleled resource for linking human genetic variation to human biology and disease Similar developments have taken place in animal and plant breeding where genetic marker information is combined with production traits An important task for the statistical geneticist is to adapt construct and implement models that can extract information from these large scale data An initial step is to understand the methodology that underlies the probability models and to learn the modern computer intensive methods required for fitting these models The objective of this book suitable for readers who wish to develop analytic skills to perform genomic research is to provide guidance to take this first step This book is addressed to numerate biologists who typically lack the formal mathematical background of the professional statistician For this reason considerably more detail in explanations and derivations is offered It is written in a concise style and examples are used profusely A large proportion of the examples involve programming with the open source package R The R code needed to solve the exercises is provided The Markdown interface allows the students to implement the code on their own computer contributing to a better understanding of the underlying theory Part I presents methods of inference based on likelihood and Bayesian methods including computational techniques for fitting likelihood and Bayesian models Part II discusses prediction for continuous and binary data using both frequentist and Bayesian approaches Some of the models used for prediction are also used for gene discovery The challenge is to find promising genes without incurring a large proportion of false positive results Therefore Part II includes a detour on False Discovery Rate assuming frequentist and Bayesian perspectives The last chapter of Part II provides an overview of a selected number of non parametric methods Part III consists of exercises and their solutions Daniel Sorensen holds PhD and DSc degrees from the University of Edinburgh and is an elected Fellow of the American Statistical Association He was professor of Statistical Genetics at Aarhus University where at present he is professor emeritus
