Chemistry and Technology of Water-Soluble Polymers C.A. Finch, 2013-06-29 To the biochemist water is of course the only solvent worthy of consideration because natural macromolecules exhibit their remarkable conformational properties only in aqueous media Probably because of these remarkable properties biochemists do not tend to regard proteins nucleotides and polysaccharides as polymers in the way that real polymer scientists regard methyl methacrylate and polyethylene The laws of polymer statistics hardly apply to native biopolymers Between these two powerful camps lies the No man's land of water soluble synthetic polymers here we must also include natural polymers which have been chemically modified The scientific literature of these compounds is characterized by a large number of patents which is usually a sign of little basic understanding of how rather than of why Many of the physical properties of such aqueous solutions are intriguing the polymer may be completely miscible with water and yet water is a poor solvent in terms of polymer parlance kind of the polymers form thermoreversible gels on heating or cooling The phenomena of exothermic mixing and salting in are common features of such systems neither can be fully explained by the available theories Finally the eccentric behaviour of polyelectrolytes is well documented Despite the lack of a sound physico chemical foundation there is a general awareness of the importance of water soluble vinyl acrylic polyether starch and cellulose derivatives as witnessed again by the vast patent literature
