

Chemistry Unit 8 Lab 2 – AgNO_3 / NaCl Reaction

Keeping Track of Matter During Chemical Change

Introduction

In this experiment, you will take the AgNO_3 you made at the end of the previous lab, form an aqueous solution of it, then allow this to react with an aqueous solution of sodium chloride, NaCl .

1. After the products have been washed and dried, the mass of the products (silver chloride and a residue) can be compared to the mass of the reactants (silver nitrate and sodium chloride).
2. You will also use mole relationships to keep track of the silver through the series of chemical changes.

Be sure that you have your data table from the previous lab (Cu/AgNO_3 lab).

Procedure

1. After you added the 6M HNO_3 to your beaker, your instructor allowed the reaction to proceed under the fume hood, and evaporated the water. Your beaker should now contain AgNO_3 , a white solid, recovered from the last experiment. However, if you failed to wash your silver adequately, the crystals will have a color. Record your observations.
2. Find the mass of the beaker + recovered AgNO_3 to the nearest 0.02g. (How does this mass compare to the mass of AgNO_3 you started with in the previous experiment?)
3. Add about 15 mL of distilled water to the beaker, and stir to dissolve the AgNO_3 crystals. **Remember the precautions about handling silver nitrate!** Be sure to rinse your stir rod into the beaker before you set it on the lab table top.
4. Find the mass of a 125 mL Erlenmeyer flask and label it. (be sure that your group and hour are on the beaker). Then slowly add NaCl from the vial at your table until you have added just over 1 gram to the beaker. Record the total mass of the flask and NaCl .
5. Dissolve the salt in about 15 mL of distilled water; stir until the crystals are dissolved.
6. While stirring the AgNO_3 solution, slowly pour the NaCl solution into the beaker. Note the solid AgCl that forms; a solid that forms upon the combination of two solutions is called a precipitate.
7. Rinse the empty flask with about 5 mL of distilled water and add this rinse to the beaker. Repeat this step. Save the flask for the filtering operation in step 9.
8. Place the beaker on a hot plate to heat the contents. Such heating causes the remainder of the solid suspended in solution (that is why the solution appears cloudy) to clump together. When the solution appears fairly clear, remove the beaker from the heat. Note: even if clarification isn't complete, remove the beaker if the solution begins to boil.
9. While the solution cools, obtain a piece of filter paper, fold it in quarters, and measure its mass. Then place the paper in the filter funnel in the manner demonstrated to you by your instructor.

See next page for diagram on folding filter paper

Wet the paper with some distilled water and press the seams flat against the side of the funnel; otherwise, air bubbles will enter the filtrate and slow the filtering operation. Place the funnel in a small ring supported by a ring stand so that the bottom of the funnel is against the inside wall of the flask.
