Systematic Sampling

Definition - a method of selecting a sample from a population by choosing every kth member

Advantages - easy to implement, ensures that the sample is spread across the population

Disadvantages - can introduce bias if there is a pattern in the population

Formula - $k = \frac{\text{Population Size}}{\text{Sample Size}}$

Example - A population of 1000 people, a sample size of 100, $k = 10$. Every 10th person is selected.

Diagram - A circle representing a population of 1000. A line goes around the circle, selecting every 10th person.

Flowchart - Start with population size, divide by sample size to get k, then select every kth member.

Simple Random Sampling

Definition - a method of selecting a sample from a population where every member has an equal chance of being selected

Advantages - unbiased, every member has an equal chance of being selected

Disadvantages - can be time-consuming and expensive

Methods - drawing names from a hat, using a random number generator

Diagram - A circle representing a population. A line goes around the circle, selecting random members.

Flowchart - Start with population size, use random selection method to select sample.

Stratified Sampling

Definition - a method of selecting a sample from a population by dividing it into strata and sampling from each

Advantages - ensures that the sample is representative of the population, reduces bias

Disadvantages - can be time-consuming and expensive

Methods - dividing population into strata, sampling from each stratum

Diagram - A circle representing a population divided into strata. A line goes around the circle, selecting members from each stratum.
