

CHAPTER 7

Digital Prepress

Abstract: The purpose of this study was to determine the effect of a 12-week training program on the physical fitness of 10-year-old children. The study was conducted in a primary school in Ankara, Turkey. The study group consisted of 20 children (10 boys and 10 girls) who were randomly selected from the school. The children were divided into two groups: a control group and an experimental group. The control group did not participate in any physical education program, while the experimental group participated in a 12-week training program. The physical fitness of the children was measured at the beginning and at the end of the 12-week period. The measurements included heart rate, blood pressure, and body mass index. The results of the study showed that the experimental group had significantly higher heart rates and blood pressures at the end of the 12-week period compared to the control group. The body mass index of the children in the experimental group also increased significantly. These findings suggest that a 12-week training program can improve the physical fitness of 10-year-old children.

Digital systems have penetrated every stage of the printing process, from formatting the author's manuscript, to platemaking and running the press. Microcomputers with multi Megabyte RAMs are considered a digital tool throughout the production process. Furthermore, consistency, speed and compatibility require that everyone involved in the production process have an understanding of digital tools.

It is possible, of course, to combine the two and use an existing computer program as the platform on which to incorporate GreenPrint. This is not the case. For five reasons, many organizations, such as the American National Standards Institute (ANSI), the International Standards Organization (ISO),

and the Joint Photographic Experts Group (JPEG) have created standards by which digital images and equipment that operate in order to be compatible. Due to the amount of information and the vast number of products available, this chapter covers general information that applies to digital image operations.

DIGITAL BASICS

The desktop computer has become the focal point of the modern manufacturing plant and shops. Its capabilities allow the graphic communications industry. The computer and associated devices, in comparison with the specialized graphics programs, are components in the *digital graphics system*, Figure 5.1.

A computer uses a binary system to process and store information in digits (bits). This means that the computer recognizes only two conditions: 0 (digit 0) and 1 (digit 1). These digits represent two values, on (1) and off (0). The individual 1s and 0s are called *bits*, or binary digits, and can be combined into groups of eight digits to create a binary word, or *byte*. Since there are four possible combinations of 1 and 0, there is an eight-bit byte that contains 256 possible combinations. A typical byte has stored in memory a specific meaning or specific combination.
