1454 TURBOCHARGING

The turbocharging system consists of:

- air filter
- variable geometry turbocharger
- "intercooler" radiator.

TURBOCHARGER

Operating principle

The variable geometry turbocharger (VGT) is a mechanical compressor and a turbine, with a variable device which adjusts the area of the passing section of the turbine.

Thanks to this variable device, the turbine can be kept in a constant position.

When gas flow is low, the narrow passage is full, a flow factor is obtained, the turbine works slowly.

The movement of the device, allowing the exhaust gas flowing section, is carried out by a mechanism, actuated by a pneumatic actuator.

This actuator is directly controlled by the electronic control and by a proportional reduced valve.

The device is in maximum closing condition at low speed. At high engine operating speed, the electronic control system is activated and increases the passing section, in order to allow the increasing gas to flow without increasing their speed.

A laminar chamber is obtained during the cooling process in the turbine body for the passage of the exhaust.
