

Genetics Practice Problems: Pedigree Tables

Remember the following when working pedigree tables:

- 1) Circles are females and squares are males.
- 2) A shaded circle or square indicates that a person has the trait.

The pedigree chart below is the inheritance of color blindness. Shaded individuals are colorblind. First, determine the probable genotype of persons 1 - 15. Then answer the questions below the table.

What do you know about the genotype of the mother of 1?

These parents (1) had a color blind son (2). His dad has no disease, but color blind allele came from his mother. Since the mother is not shaded, she must be a carrier.

Number 3 is colorblind, just like her father. Where could she get her allele for colorblindness?

She inherited her allele for colorblindness from her mother. Must have been that 2's chromosomes from their father.

Number numbers 11 and 12 were colorblind. How did they have a colorblind son (13)?

Both mother and father are carriers for color blindness.

What must be the genotype of the parents of a colorblind daughter? Explain.

To have a color blind daughter, she must have the recessive allele on both of her parents. Her father must be X^c Y and mother must have to be X^c X^c.

If mother 11 has a normal son, what is the probability that their son will be colorblind?

$X^N X^c \times X^c Y \rightarrow$ all of their sons will have color blind.

(50%) (normal male)

Vogel and Motulsky's Human Genetics Friedrich Vogel,Arno G. Motulsky,2013-04-17 The first two editions of this book published in 1979 and in 1986 were well received by the scientific community Translations into Italian Japanese and Russian suggest that this book was regarded useful in many parts of the world Mean while human genetics has seen dramatic developments and the molecular revolution has attracted thousands of scientists including many molecular biologists to this field About 3700 human genes have already been mapped to chromosomal sites Many such genes have been cloned and the various mutations causing disease have been identified Novel mutational mechanisms such as expanded trinucleotide repeats have been discovered in conditions such as Huntington's disease and the fragile X syndrome of mental retardation Gene action now can often be elucidated by studying the pathway from gene to phenotype following positional cloning rather than working in the opposite direction as was customarily done before the tools of new genetics were available In an increasing number of genetic diseases the pathogenic mechanisms have been elucidated with positive consequences for prevention and treatment It therefore became necessary to rewrite almost completely major portions of this book These developments are now making genetics arguably the leading basic science for medicine as well as a recognized medical speciality But all these changes do not mean that the entire framework of human genetics had to be reconstructed
